6.4.3. High Speed Mode – Rise and Fall Timings.....	231

6.4.4. Low Speed Mode – Bus Turn Around	232
6.4.5. Data Lanes from Low Power Mode to High Speed Mode.....	233
6.4.6. Data Lanes from High Speed Mode to Low Power Mode.....	234
6.4.7.DSI Clock Burst – High Speed Mode to/from Low Power Mode	235

Introduction

GC9B71 is a 262,144-color single-chip SOC driver for a-TFT liquid crystal display with resolution of 360RGBx360 dots, comprising a 540-channel source driver, a 32-channel gate driver, 291,600 bytes GRAM for graphic display data of 360RGBx360 dots, and power supply circuit.

GC9B71 supports parallel 8-bit data bus MCU interface, 3-/4-line serial peripheral interface (SPI) and Quad serial peripheral interface and MIPI interface. The moving picture area can be specified in internal GRAM by window address function. The specified window area can be updated selectively, so that moving picture can be displayed simultaneously independent of still picture area.

GC9B71 supports full color, 8-color display mode and sleep mode for precise power control by software and these features make the GC9B71 an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP where long battery life is a major concern.

1. Features

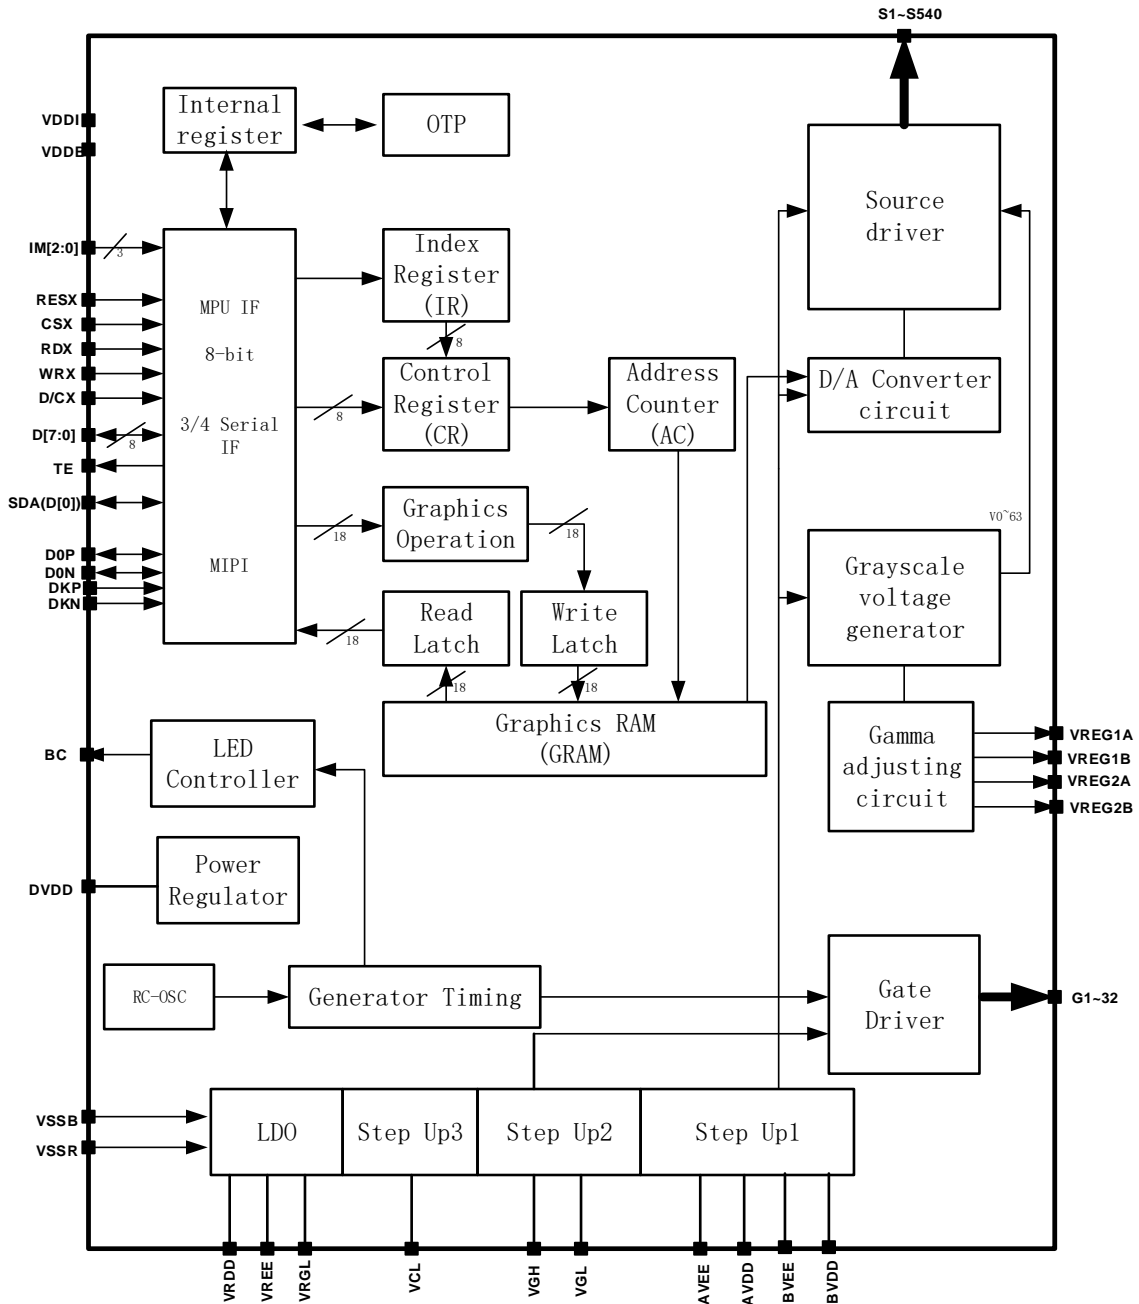

- ◆ Dual gate TFT LCD driver with OD OC
- ◆ Display resolution: [360 RGB] (H) x 360(V)
- ◆ Output:
 - 540 source outputs
 - 32 gate outputs
- ◆ Resolution:
 - 240x240: S91-S450
 - 320x320: S31-S510
 - 320x360: S31-S510
 - 360x360: S1-S540
 - 320x390: S31-S510
- ◆ a-TFT LCD driver with on-chip full display RAM: 291,600 bytes
- ◆ System Interface
 - 8-bits, MCU 8080-I
 - 8-bits, 9-bits Serial Peripheral Interface (SPI) and 2 data lane SPI
 - Quad Serial Peripheral Interface
 - MIPI (1 lane)
- ◆ Display mode:
 - Full color mode (Idle mode OFF): 16.7M-color (with dither in QSPI interface only)
 - Full color mode (Idle mode OFF): 262K-color (selectable color depth mode by software)
 - Reduce color mode (Idle mode ON): 8-color
- ◆ Power saving mode:
 - Sleep mode
- ◆ Frame rate
 - Normal mode (20Hz~65Hz)
 - Idle mode (1Hz~60Hz)
- ◆ On chip functions:
 - Timing generator
 - Oscillator
 - DC/DC converter
 - column , dot inversion
- ◆ Low -power consumption architecture
 - Low operating power supplies:
 - VDDI = 1.65V ~ 3.3V (logic)
 - VDDB = 2.5V ~ 3.3V (analog)
- ◆ LCD Voltage drive:
 - Source/Gamma power supply voltage
 - Vreg1A ~ vreg2A = 6.5V ~-4.4V
 - Gate driver output voltage
 - VGH - GND = 8.0V ~ 15.0V
 - VGL - GND = -12.0V ~ -7.0V

- VCOM connect to GND
- ◆ Operate temperature range: -40°C to 80°C

2. Block Diagram

2.1. Block diagram

Figure1

2.2. Pin Description

Table 1.

Power Supply Pins			
Pin Name	I/O	Connect Pin	Descriptions
VDDI(IOVCC)	I	VDDI	Low voltage power supply for interface logic circuits(1.65~3.3V)
VDDDB(VCI)	I	VDDDB	High voltage power supply for analog circuit blocks(2.5~3.3V)
VSSB/VSSR	I	GND	System ground level

Table 2

Interface Logic Signals								
Pin Name	I/O	Connect Pin	Descriptions					
IM[2:0]	I	(VDDI/ GND)	-Select the MCU interface mode					
			IM2	IM1	IM0	MCU-Interface	Pins in use	
							Register	GRAM
			0	0	0	8080- MCU 8bit interface I	D[7:0]	D[7:0]
			0	X	X	X	X	X
			1	0	0	QSPI	SDA/D[0]	SDA/D[0], D[3:1]
1	0	1	3-wire 9-bit data serial interface I	SDA/D[0]	SDA/D[0]			
1	1	0	MIPI	DOP,DON,DKP,DKN				
1	1	1	4-wire 8-bit data serial interface I	SDA/D[0]	SDA/D[0]			
MPU Parallel interface bus and serial interface select Fix this pin at VDDI or GND.								
RESX	I	MCU (VDDI/GND)	This signal will reset the device and must be applied to properly initialize the chip. Signal is active low.					
CSX	I	MCU (VDDI/GND)	Chip select input pin("Low" enable). This pin can be permanently fixed "Low" in MPU interface mode only.					
D/CX (SCL)	I	MCU (VDDI/ GND)	This pin is used to select "Data or Command" in the parallel interface When DCX='1', data is selected. When DCX='0', command is selected. This pin is used serial interface clock in 3-wire 9-bit / 4-wire 8-bit /QSPI serial interface. If not used, this pin should be connected to VDDI or GND.					
RDX	I	MCU (VDDI/ GND)	8080-I/8080-II system (RDX): Serves as a read signal and MCU read data at the rising edge. Fix to VDDI level when not in use					
WRX (D/CX)	I	MCU (VDDI/ GND)	8080-I/8080-II system (WRX): Serves as a write signal and writes data at the rising edge. 4-wire system (D/CX): Serves as command or parameter select. 3-wire 2data mode: Serves as second data pin Fix to VDDI level when not in use.					
D[7:0] D[0]/SDA	I/O	MCU (VDDI/ GND)	8-bit parallel bi-directional data bus for MCU system When IM[2]=1, D[0]server as SDA as Serial in/out signal in 3-wire 9-bit/4-wire 8-bit/QSPI serial data interface. In QSPI 4wire mode D[3:1] Server as SDA[3:1] Fix to GND level when not in use					
TE	O	MCU (VDDI/ GND)	Tearing effect output pin to synchronize MPU to frame writing, activated by S/W command. When this pin is not activated, this pin is					

GC9B71 DataSheet

			low. If not used, open this pin.
DKP/ Clock_P	I	MIPI	- Positive polarity of low voltage differential clock signal If MIPI are not used, they should be connected to GND.
DKN/ Clock_N	I	MIPI	- Negative polarity of low voltage differential clock signal If MIPI are not used, they should be connected to GND.
DOP/ Data_P	I/O	MIPI	- Positive polarity of low voltage differential data signal If MIPI are not used, they should be connected to GND
DON/ Data_N	I/O	MIPI	- Negative polarity of low voltage differential data signal If MIPI are not used, they should be connected to GND
PSWAP	I	MCU(VDDI/GND)	Differential clock polarity swap For MIPI DSI interface 0: DOP->DOP, DON->DON; DKP->DKP, DKN->DKN, 1: DOP->DON, DON->DOP; DKP->DKN, DKN->DKP,
VCOM	I	GND	Fix to GND
TESTP	O	OPEN	Test pin
TESTN	O	OPEN	Test pin

Note:

1. If CSX is connected to GND in Parallel interface mode, there will be no abnormal visible effect to the display module. Also there will be no restriction on using the Parallel Read/Write protocols, Power On/Off Sequences or other functions. Further more there will be no influence to the Power Consumption of the display module.
2. When CSX='1', there is no influence to the parallel and serial interface.

Table 3

LCD Driver Input/Output Pins			
Pin Name	I/O	Connect Pin	Descriptions
S540~S1	O	LCD	Source output signals.
			Leave the pin to open when not in use.
G1~G32	O	LCD	Gate output signals.
			Leave the pin to open when not in use.
VCOM	O	GND	Connect to GND.
VRDD	O	Power	Power supply for AVDD.
VREE	O	Power	Power supply for AVEE.
DVDD	O	Power	Regulated Low voltage level for interface circuits Don't apply any external power to this pin
VRGL	O	Power	Power supply for VCL.
AVDD	O	Power	Analog power for Source.
AVEE	O	Power	Analog power for Source.
VGH	O	Power	Power supply for the gate driver(Positive).
VGL	O	Power	Power supply for the gate driver(Negative).
VREG1A	O	Ref	VREG1A is the highest positive grayscale reference voltage of source driver.
VREG1B	O	Ref	VREG1B is the lowest positive grayscale reference voltage of source driver. test by VREGP pin
VREG2B	O	Ref	VREG2B is the lowest negative grayscale reference voltage of source driver, test by VREGP pin
VREG2A	O	Ref	VREG2A is the highest negative grayscale reference voltage of source driver , test VREGN pin
BC	O	Dig IO	Output pin for PWM (Pulse width Modulation) signal of LED driving.
			If not used, open this pin.

Table 4

Test Pins			
Pin Name	I/O	Connect Pin	Descriptions
OSC_IN	I/O	Open	Test pin
OSC_TEST	I/O	Open	Test pin
VPP	I/O	Open	Test pin
DUMMY	-	Open	Input pads used only for test purpose at IC-side. During normal operation , leave these pads open.

Liquid crystal power supply specifications Table
Table 5

No.	Item	Description	
1	TFT Source Driver	support 360*RGB (max)	
2	TFT Gate Driver	32 pins	
3	TFT Display's Capacitor Structure	Cst structure only (Cs on Common)	
4	Liquid Crystal Drive Output	S1~S540	V0~V63 grayscales
		G1~G32	VGH-VGL
5	Input Voltage	VDDI	1.65~3.30V
		VDDDB	2.50~3.30V
6	Liquid Crystal Drive Voltages	AVDD	6.5~7.5V
		AVEE	-5.5V~-4.5V
		VGH	8.0~15.0V
		VGL	-11.0~-7.0V
		VCL	-3.0~-1.5V
7	Internal Step-up Circuits	AVDD	VDDDB*3
		AVEE	VDDDB*-2
		VGH	VDDDB*5
		VGL	VDDDB*-5
		VCL	VDDDB*-1

3. Interface setting

3.1. MCU interfaces

GC9B71 provides the 8-bit parallel system interface for 8080-I, and 3-/4-line serial system interface for serial data input, QSPI and MIPI interface. The input system interface is selected by external pins IM [2:0] and the bit format per pixel color order is selected by DBI [2:0] 3-bits of 3Ah register.

3.1.1. MCU interface selection

The selection of interface is done by setting external pins IM [2:0] as shown in the following table.

Table 6

IM2	IM1	IM0	MCU-Interface Mode	Pins in use	
				Register/Content	GRAM
0	0	0	8080- MCU 8bit bus interface I	D[7: 0]	D[7: 0] , WRX,RDX,CSX,D/CX
0	X	X	X	X	X
1	0	0	Quad serial interface	SDA/D[0]	SDA/D[0], D[3:1],CLK,CSX
1	0	1	3-wire 9-bit data serial interface I	SDA/D[0]	SCL, SDA/D[0], CSX
1	1	0	MIPI	DOP, DON, DKP, DKN	
1	1	1	4-wire 8-bit data serial interface I	SDA/D[0]	SCL, SDA/D[0], D/CX, CSX

3.1.2.8080-I Series Parallel Interface

GC9B71 can be accessed via 8-bit MCU 8080-I series parallel interface. The chip select CSX (active low) is used to enable or disable GC9B71 chip. The RESX (active low) is an external reset signal. WRX is the parallel data write strobe, RDX is the parallel data read strobe and D[7:0] is parallel data bus.

GC9B71 latches the input data at the rising edge of WRX signal. The D/CX is the signal of data/command selection. When D/CX='1', D [7:0] bits are display RAM data or command's parameters. When D/CX='0', D[7:0] bits are commands.

The 8080-I series bi-directional interface can be used for communication between the MCU controller and LCD driver chip. The selection of 8080-I series parallel interface is shown as the table in the following.

Table 7

IM2	IM1	IM0	MCU-Interface	CSX	WRX	RDX	D/CX	Function
0	0	0	8080 MCU 8-bit bus interface I	"L"	↑	"H"	"L"	Write command code.
				"L"	"H"	↑	"H"	Read internal status.
				"L"	↑	"H"	"H"	Write parameter or display data.
				"L"	"H"	↑	"H"	Reads parameter or display data.

3.1.3. Write Cycle Sequence

The WRX signal is driven from high to low and then be pulled back to high during the write cycle. The host processor provides information during the write cycle when the display module captures the information from host processor on the rising edge of WRX. When the D/CX signal is driven to low level, then input data on the interface is interpreted as command information. The D/CX signal also can be pulled high level when the data on the interface is SRAM data or command's parameter.

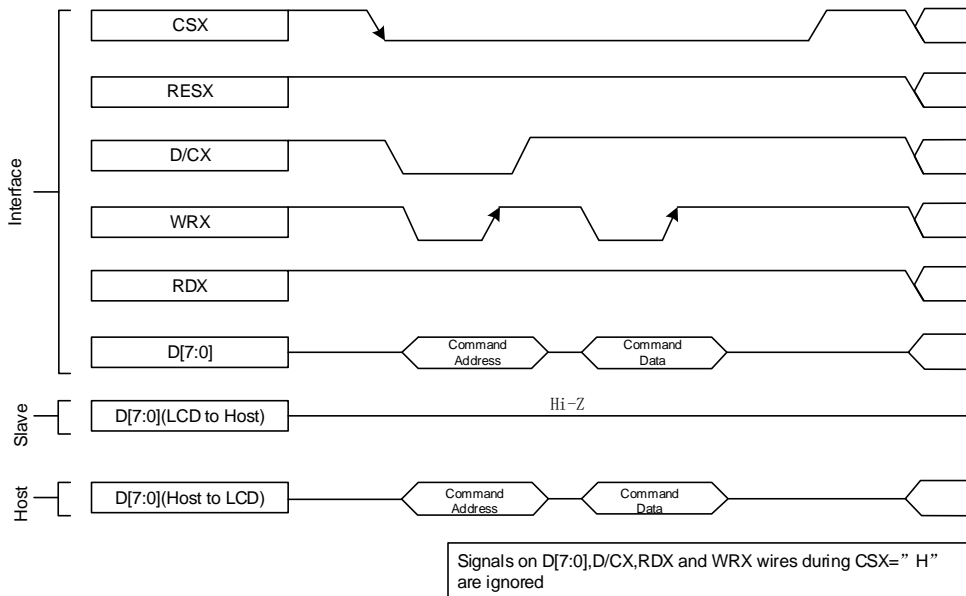

The following figure shows a write cycle for the 8080-I MCU interface.

Figure 2.

Note: WRX is an unsynchronized signal (It can be stopped)

Figure 3.

3.1.5. Serial Interface

The selection of interface is done by IM [2:0] bits. Please refer to the Table in the following.

Table 8.

IM2	IM1	IM0	MCU-Interface Mode	CSX	D/CX	SCL	Function
1	0	1	3-line serial interface I	"L"	-	↑	Read/Write command, parameter or display data.
1	1	1	4-line serial interface I	"L"	"H/L"	↑	Read/Write command, parameter or display data.

GC9B71 supplies 3-lines/ 9-bit and 4-line/8-bit bi-directional serial interfaces for communication between host and GC9B71. The 3-line serial mode consists of the chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA). The 4-line serial mode consists of the Data/ Command selection input (D/CX), chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA) for data transmission. The data bus (D [7:0]), which are not used, must be connected to GND. Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

3.1.6. Write Cycle Sequence

The write mode of the interface means that host writes commands or data to GC9B71. The 3-lines serial data packet contains a data/command select bit (D/CX) and a transmission byte. If the D/CX bit is “low”, the transmission byte is interpreted as a command byte. If the D/CX bit is “high”, the transmission byte is stored as the display data RAM(Memory write command),or command register as parameter.

Any instruction can be sent in any order to GC9B71 and the MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse and SDA data are no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. See the detailed data format for 3-/4-line serial interface.

Figure 10.

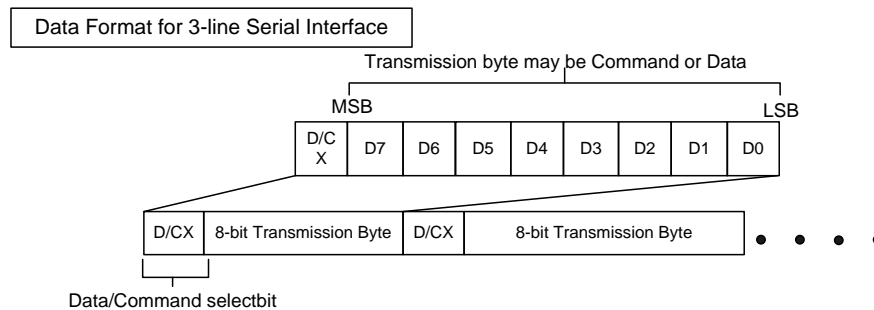

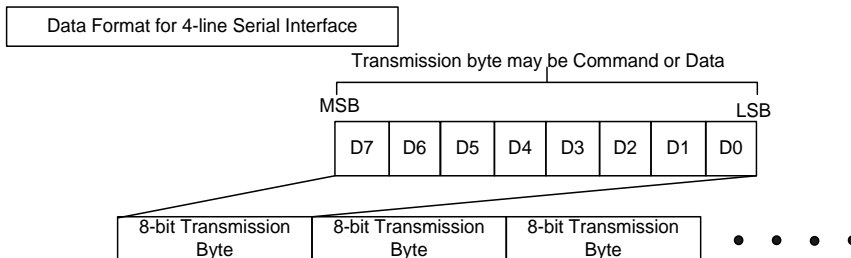

Figure11.

Host processor drives the CSX pin to low and starts by setting the D/CX bit on SDA. The bit is read by GC9B71 on the first rising edge of SCL signal. On the next falling edge of SCL, the MSB data bit (D7) is set on SDA by the host. On the next falling edge of SCL, the next bit (D6) is set on SDA. If the optional D/CX signal is used, a byte is eight read cycle width. The 3/4-line serial interface writes sequence described in the figure as below.

Figure 12.

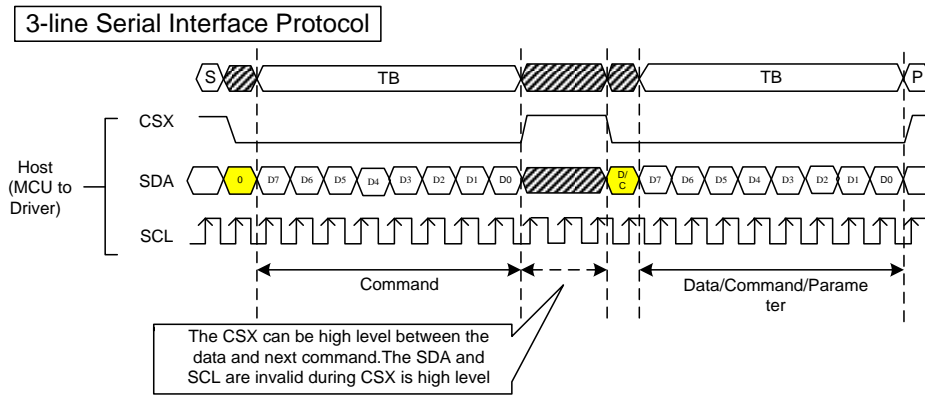

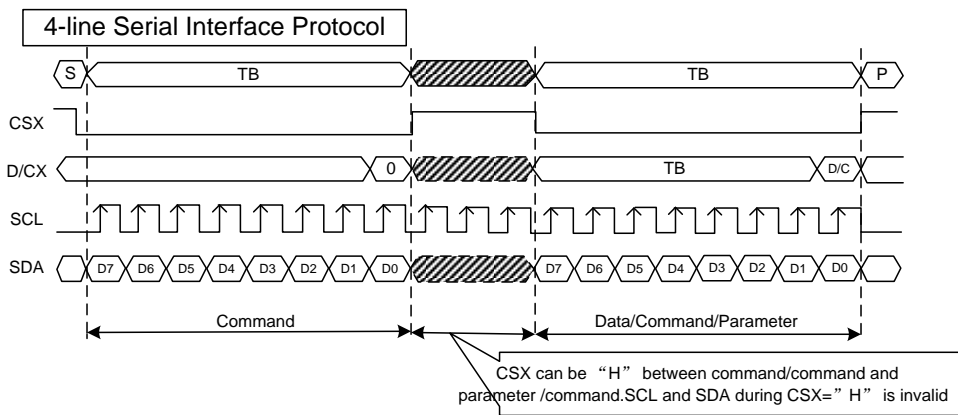

Figure 13.

3.1.7. Read Cycle Sequence

The read mode of interface means that the host reads register's parameter from GC9B71. The host has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. GC9B71 latches the SDA (input data) at the rising edges of SCL (serial clock), and then shifts SDA (output data) at falling edges of SCL (serial clock). After the read status command has been sent, the SDA line must be set to tri-state and no later than at the falling edge of SCL of the last bit. The read mode has three types of transmitted command data (8-/24-/32-bit) according to command code.

Figure 14.

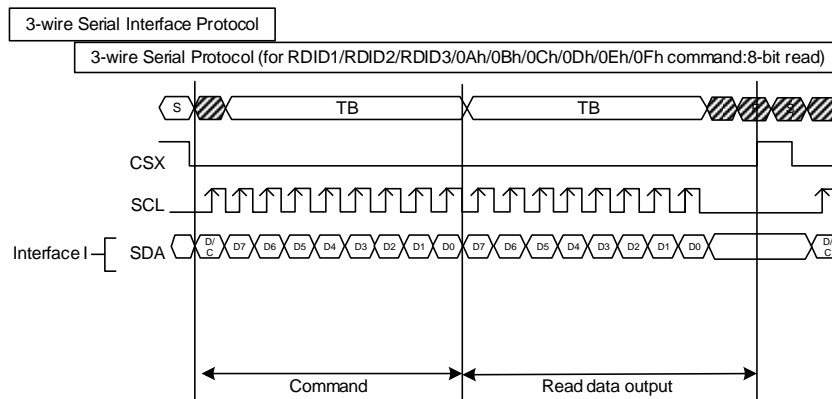

Figure 15.

Figure 16.

Figure 17.

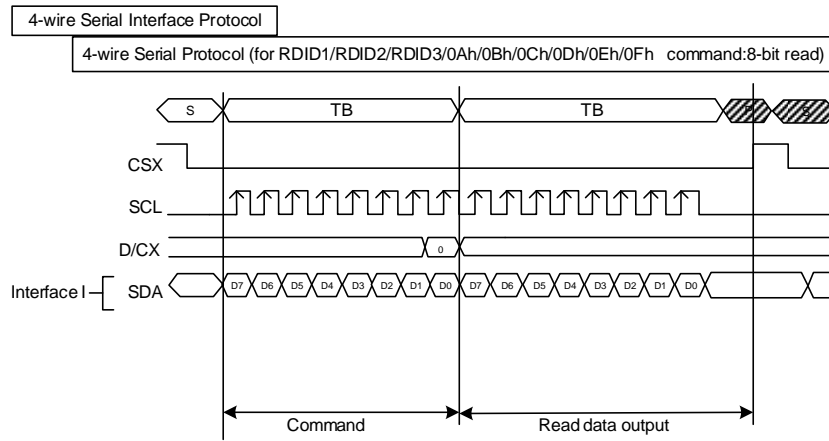

Figure 18.

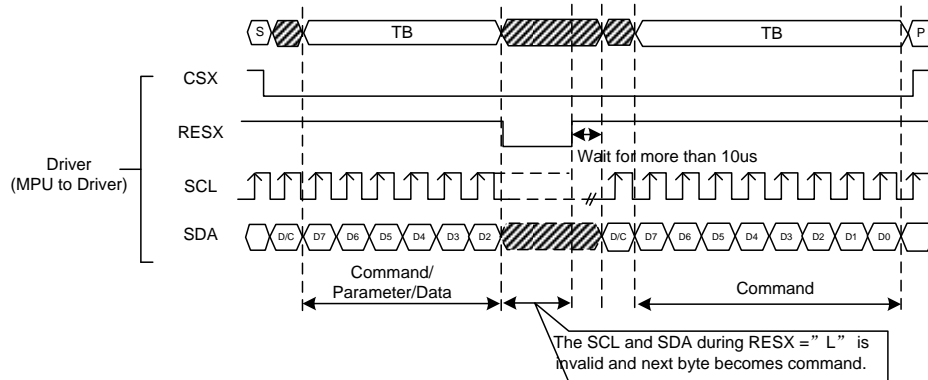

Figure 19.

3.1.8.Data Transfer Break and Recovery

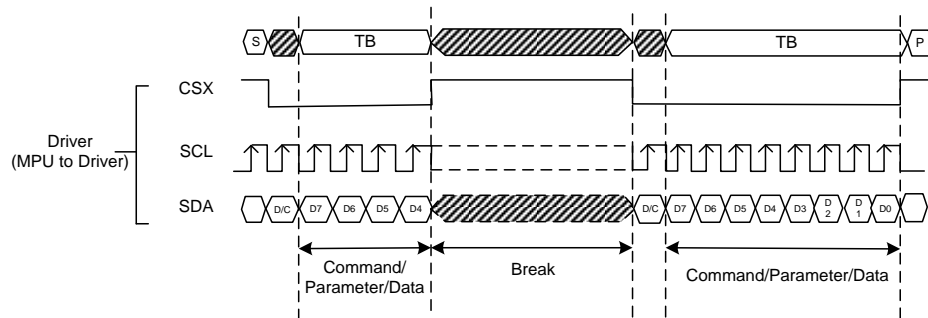

If there is a break in data transmission by RESX pulse, while transferring a command or multiple parameter command data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select pin (CSX) is activated after RESX have been high state.

Figure 20.

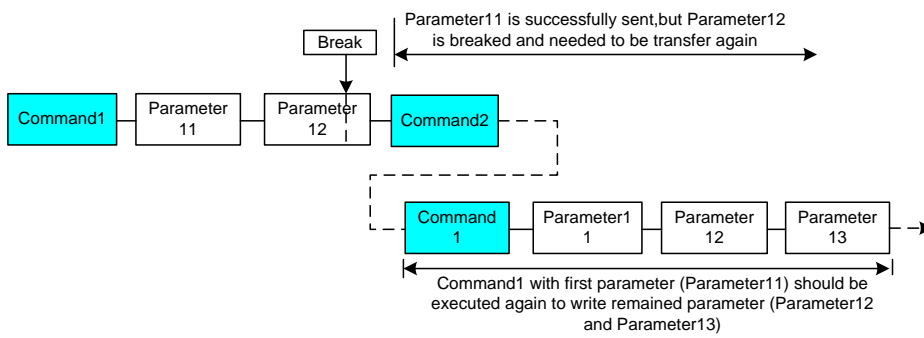

If there is a break in data transmission by CSX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select pin (CSX) is next activated.

Figure 21.

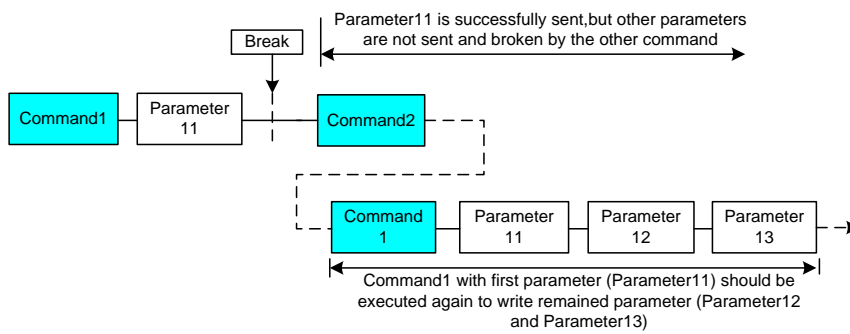

If two or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than continue to send the remained parameters that was interrupted, then the parameters which had been successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

Figure 22.

If a two or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters which had been successfully sent are stored and the other parameter of that command remains previous value.

Figure 23.

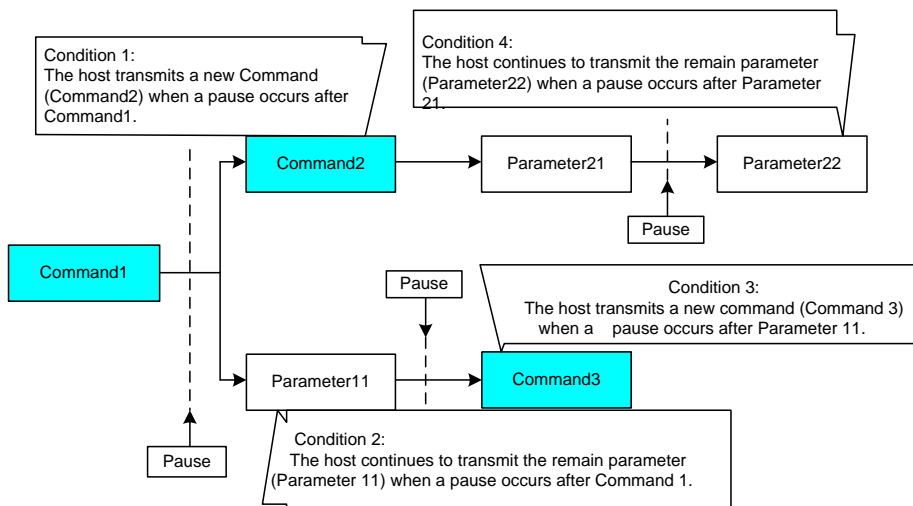

3.1.9.Data Transfer Pause

It will be possible when transferring a command, frame memory data or multiple parameter data to invoke a pause in the data transmission. If the chip select pin (CSX) is released to high state after a whole byte of a frame memory data or multiple parameter data has been completed, then GC9B71 will wait and continue the frame memory data or parameter data transmission from the point where it was paused. If the chip select pin is released after a whole byte of a command has been completed, then the display module will receive either the command’s parameters(if appropriate) or a new command when the chip select pin is next enabled as shown below.

This applies to the following 4 conditions:

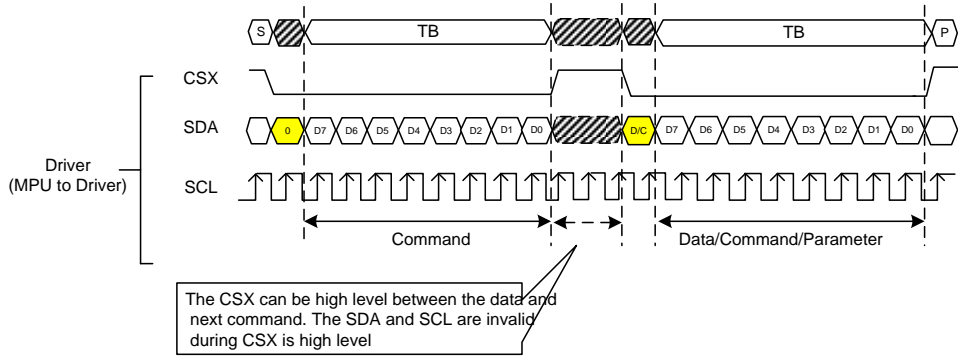

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

Figure 24.

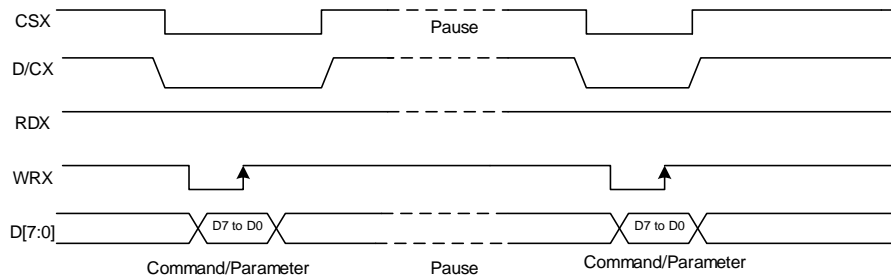

3.1.10. Serial Interface Pause (3_wire)

Figure 25.

3.1.11. Parallel Interface Pause

Figure 26.

3.1.12. Data Transfer Mode

GC9B71 can provide two different kinds of color depth (16-bit/pixel and 18-bit/pixel) display data to the graphic RAM. The data format is described for each interface. Data can be downloaded to the frame memory by 2 methods.

3.1.13. Data Transfer Method 1

The image data is sent to the frame memory in the successive frame writing, each time the frame memory is filled by image data, the frame memory pointer is reset to the start point and the next frame is written.

Figure 27.

3.1.14. Data Transfer Method 2

Image data is sent and at the end of each frame memory download, a command is sent to stop frame memory writing. Then start memory write command is sent, and a new frame is downloaded.

Figure 28.

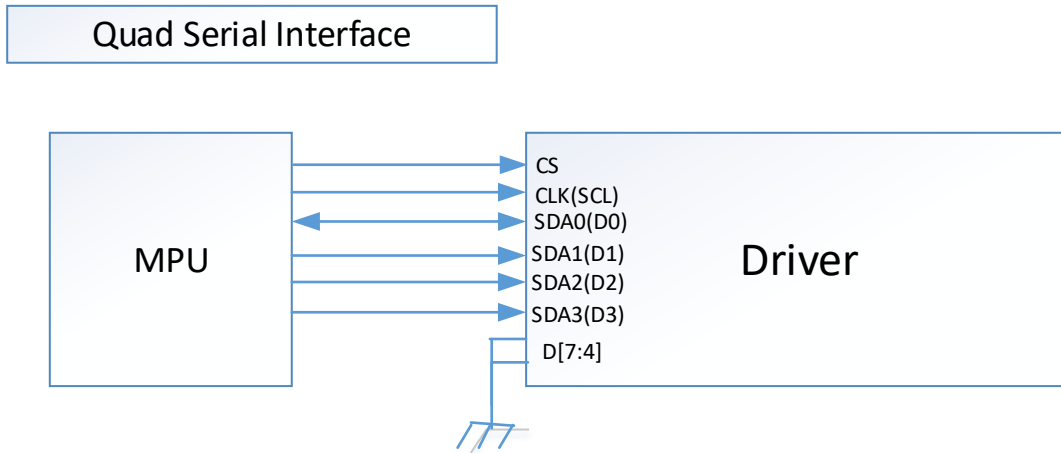

Note 1: These methods are applied to all data transfer color modes on both serial and parallel interfaces.

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

3.1.15. Quad Serial Peripheral Interface

The Quad Serial Peripheral Interface of GC9B71 can be selected by setting hardware pin IM [2:0] to “100”. The following shown figure is the example of interface with Quad Serial Peripheral Interface.

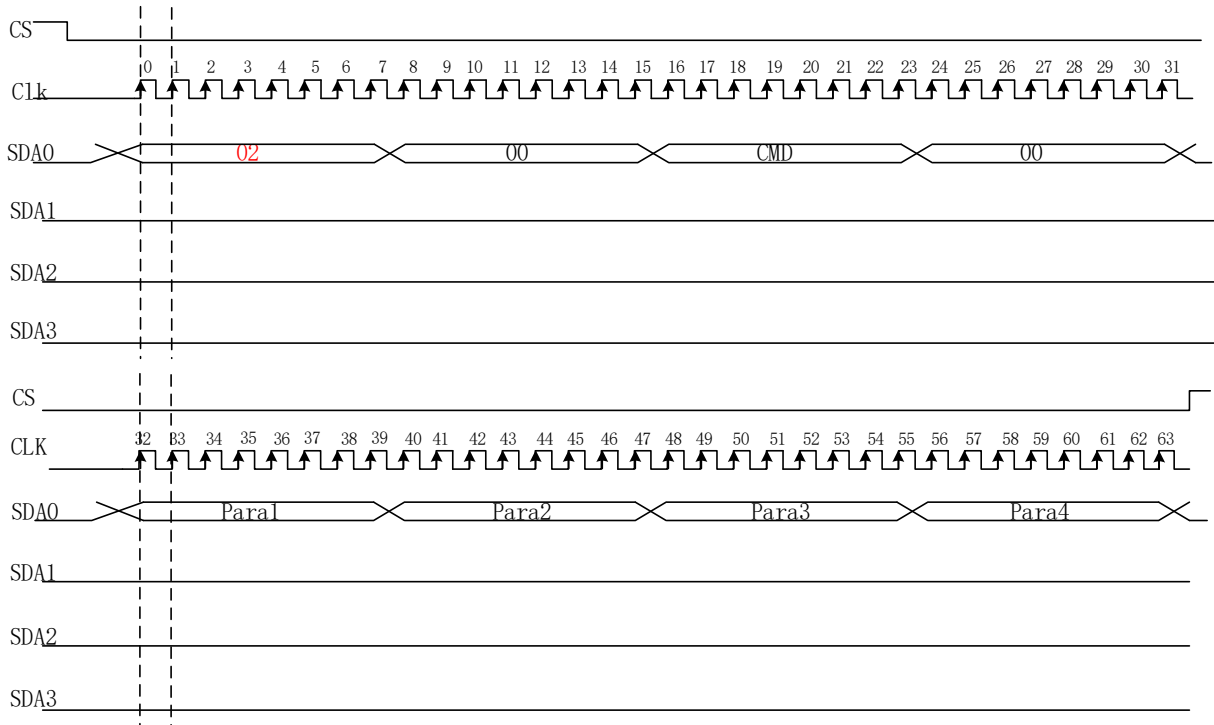

3.1.16. Write Cycle Sequence

The GC9B71 reads the data at the rising edge of SCL signal.

The timing of Write Cycle Sequence is shown as below

CMD_WR only use SDA0/D0, first byte=0x02

Eg:11

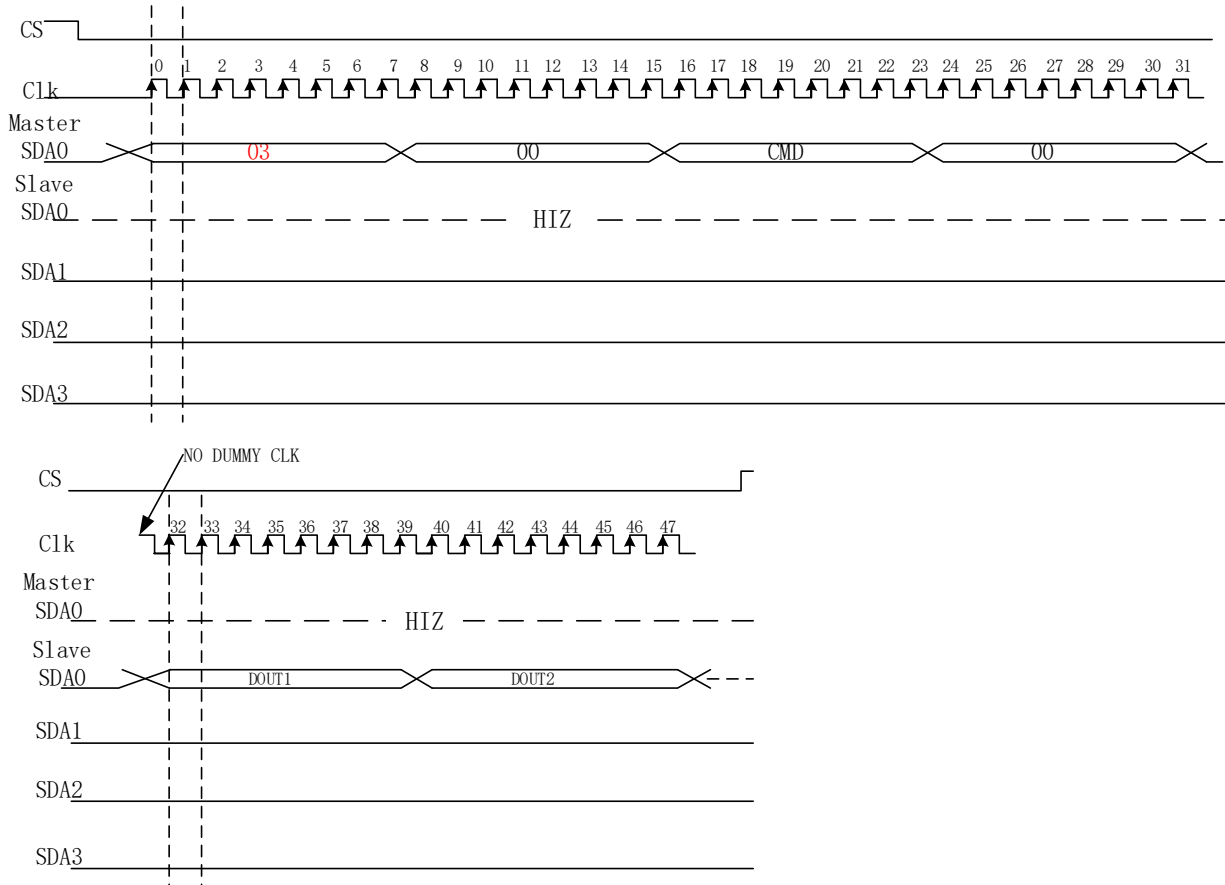

Eg: 2A=00, 00, 01, 8f

3.1.17. Read Cycle Sequence

The timing of Read Cycle Sequence is shown as below

CMD_RD: Only Use SDA0/D0, First Byte=0x03

3.2. Display Data RAM (DDRAM)

GC9B71 has an integrated 360x360x18-bit graphic type static RAM. This 291,600 -bytes memory allows storing a 36xRGBx360 image with an 18-bit resolution (262K-color). There is no abnormal visible effect on the display when there are simultaneous panel display read and interface read/write to the same location of the frame memory.

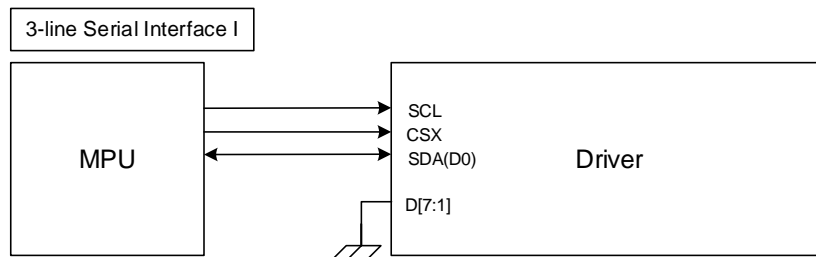

3.3. Display Data Format

GC9B71 supplies 8-bit parallel MCU interface with 8080- I ,3-/4-line serial interface ,The parallel MCU interface and serial interface mode can be selected by external pins IM [2:0]

3.3.1. 3-line Serial Interface

The 3-line/9-bit serial bus interface of GC9B71 can be used by setting external pin as IM [2:0] to “101” for serial interface. The shown figure is the example of 3-line SPI interface.

Figure39.

In 3-line serial interface, different display data format is available for three color depths supported by the LCM listed below.

-4k colors, RGB 4, 4, 4 -bits input.

-65k colors, RGB 5, 6, 5 -bits input

-262k colors, RGB 6, 6, 6 -bits input.

1)4K-Colors:12-bit/pixel(RGB 4, 4, 4 -bits input).

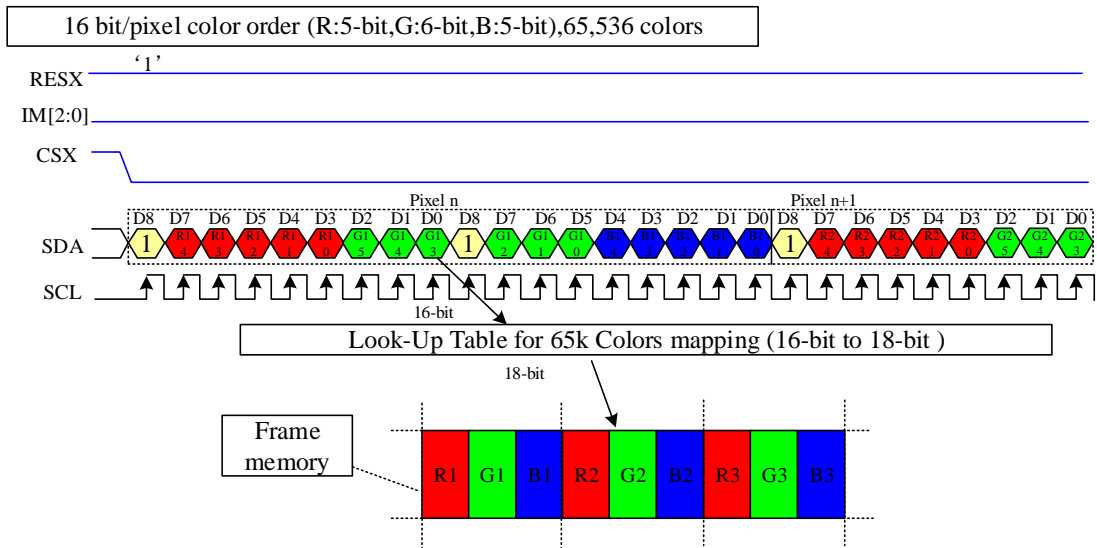

Figure41.

- Note 1: The pixel data with 12-bit color depth information.
- Note 2: The most significant bits are: Rx3, Gx3 and Bx3.
- Note 3: The least significant bits are: Rx0, Gx0 and Bx0.
- Note 4: '-=' Don't care –Can be set "0" or "1".

2)65K-Colors:16-bit/pixel(RGB 5, 6, 5 -bits input).

Figure41.

- Note 1: The pixel data with 16-bit color depth information.
- Note 2: The most significant bits are: Rx4, Gx5 and Bx4.
- Note 3: The least significant bits are: Rx0, Gx0 and Bx0.
- Note 4: '-=' Don't care –Can be set "0" or "1".

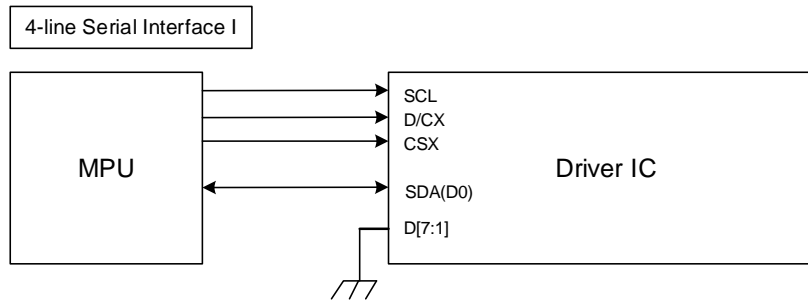

3)262K-Colors:18-bit/pixel(RGB 6, 6, 6 -bits input).

Figure42.

3.3.2. 4-line Serial Interface

The 4-line/8-bit serial bus interface of GC9B71 can be used by setting external pin as IM [2:0] to “111” for serial interface . The shown figure is the example of 4-line SPI interface.

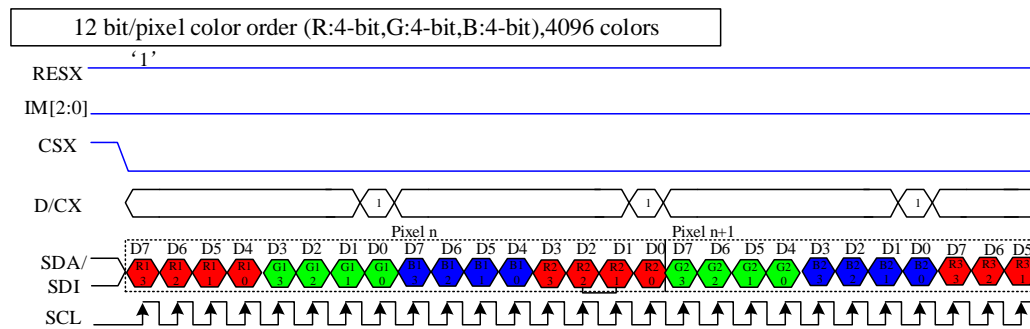

Figure43.

In 4-line serial interface, different display data format is available for two color depths supported by the LCM listed below.

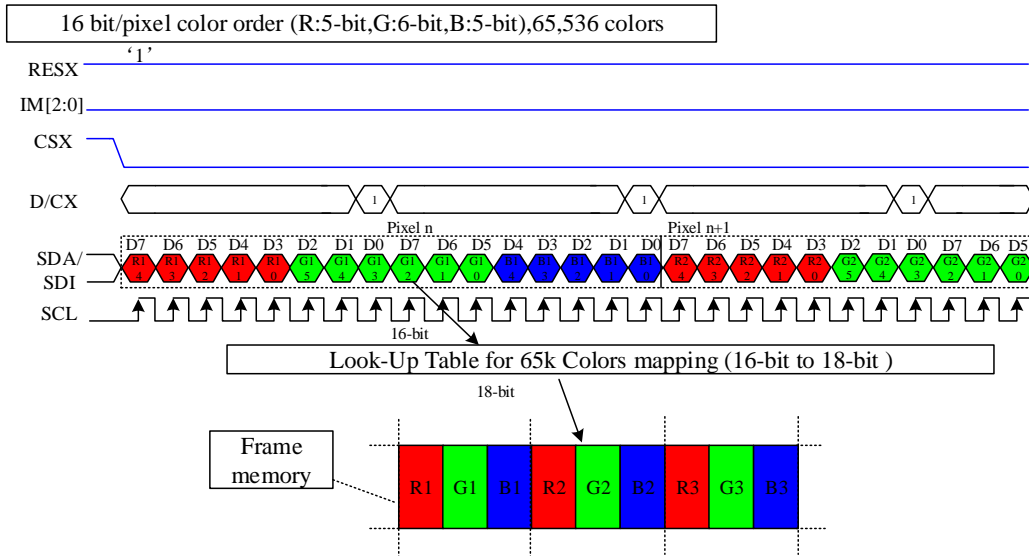

- 4k colors, RGB 4, 4, 4 -bits input.
- 65k colors, RGB 5, 6, 5 -bits input.
- 262k colors, RGB 6, 6, 6 -bits input.

Figure44.

- Note 1: The pixel data with 12-bit color depth information.
- Note 2: The most significant bits are: Rx3, Gx3 and Bx3.
- Note 3: The least significant bits are: Rx0, Gx0 and Bx0.
- Note 4: ‘-’= Don't care –Can be set “0” or “1”.

Figure45.

Note 1: The pixel data with 16-bit color depth information.

Note 2: The most significant bits are: Rx4, Gx5 and Bx4.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-' = Don't care –Can be set "0" or "1".

Figure46.

Note 1: The pixel data with 18-bit color depth information.

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-' = Don't care –Can be set "0" or "1".

3.3.3.2-data-lane mode

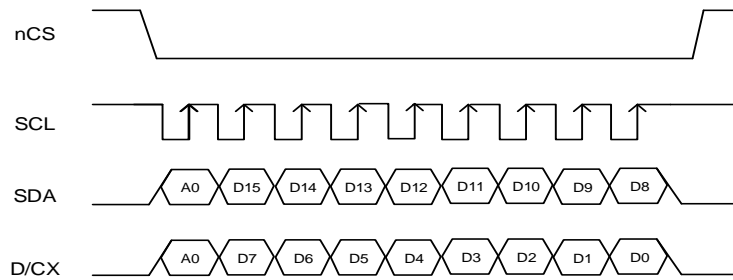

This mode is active when 2data_en (B1h[3]) set to “1” in 3-wire. Only frame pixel data write transitions are sent in 2-data-lane mode, register write/read is still sent in 3-wire.

The chip-select nCS (active low) enables and disables the serial interface. SCL is the serial data clock. SDA and DCX are serial data lines. The shown figure is the example of 3-line SPI interface.

Serial data must be input to SDA in the sequence A0, D15 to D10 and DCX in the sequence A0, D7 to D0. The GC9B71 reads the data at the rising edge of SCL signal. The first bit of serial data A0 is data/command flag. It must be set to "1", D15 to D0 bits are display RAM data.

Figure47.

Five data formats are supported in 2-data-lane mode, which is indicated by 2data_mdt (B1h[2:0]) .

1)RGB565 1pixel/transition(65K color,2data_mdt[2:0]='000')

Figure48.

2)RGB666 1pixel/transition(262K color,2data_mdt[2:0]='001')

Figure49.

3)RGB666 2/3pixel/transition(262K color,2data_mdt[2:0]='010')

Figure50.

3.3.4. 8-bit Parallel MCU Interface

The 8080- I system 8-bit parallel bus interface of GC9B71 can be used by setting external pin as IM [2:0] to “000”.The following shown figure is the example of interface with 8080- I MCU system interface.

Figure53.

Different display data formats are available for two color depths supported by listed below.

- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

1) 65K-Colors:16-bit/pixel(RGB 5, 6, 5 -bits input).

One pixel (3 sub-pixels) display data is sent by 2 byte transfers when DBI [2:0] bits of 3Ah register are set to “101”.

Table 11.

Count	0	1	2	3	4	...	717	718	719	720

3.3.5. Quad Serial Peripheral Interface

In quad serial Peripheral interface, different display data format is available for three color depths supported by the LCM listed below.

- 16.7M colors RGB 8, 8, 8-bits input with dither on by setting DBI[2:0]=7(3Ah) and DTR_EN=1 (B1h)
- 262k colors, RGB 6, 6, 6 -bits input.
- 65k colors, RGB 5, 6, 5 -bits input
- 256 colors, RGB 3, 3, 2 -bits input
- 8 colors, RGB 1, 1, 1-bits input
- 256 gray, data: BIN00000000~BIN11111111

1wire data: only use SDA0/D0, first byte=0x02

1) 16.7M-Colors:24-bit/pixel (RGB 8, 8, 8 -bits input).

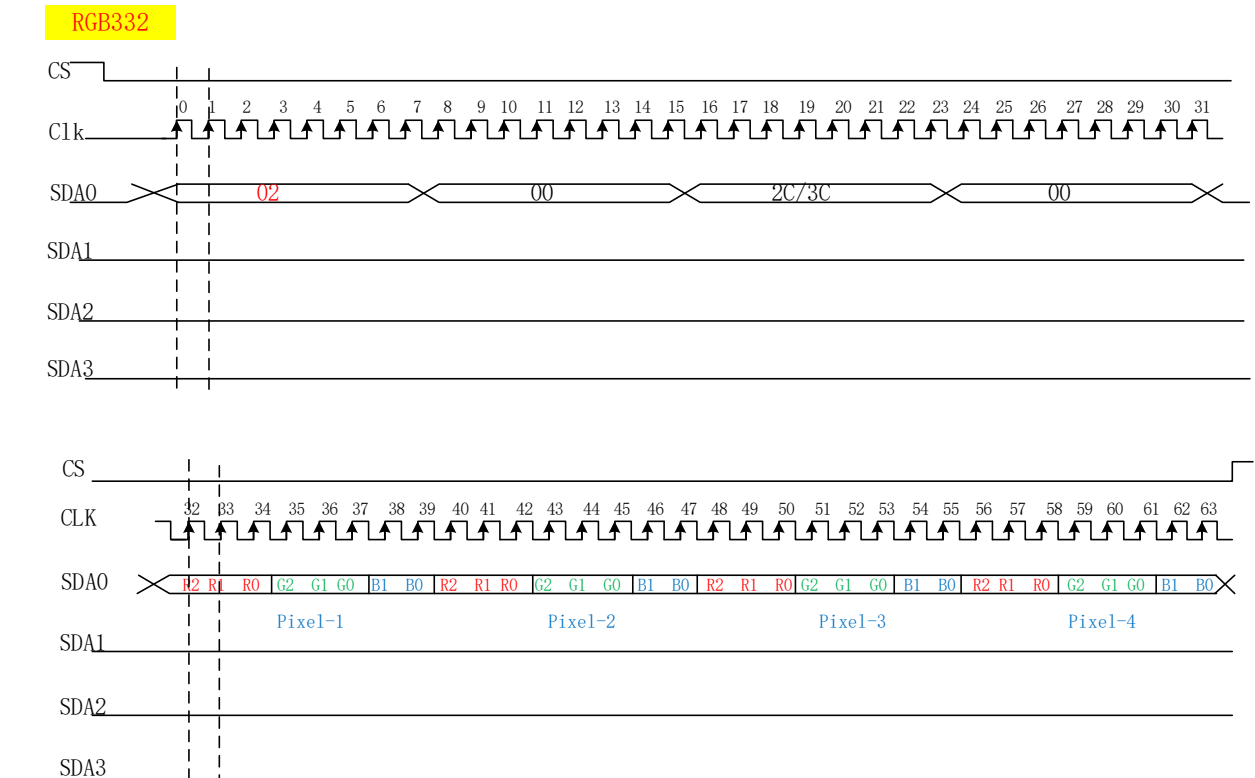

2) 262k-Colors:18-bit/pixel (RGB 6, 6, 6-bits input).

3) 65k-Colors:16-bit/pixel (RGB 5, 6,5 -bits input).

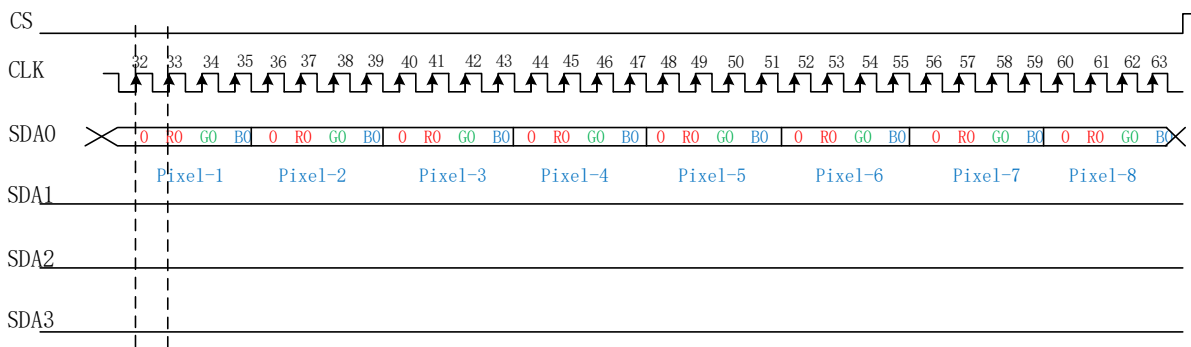

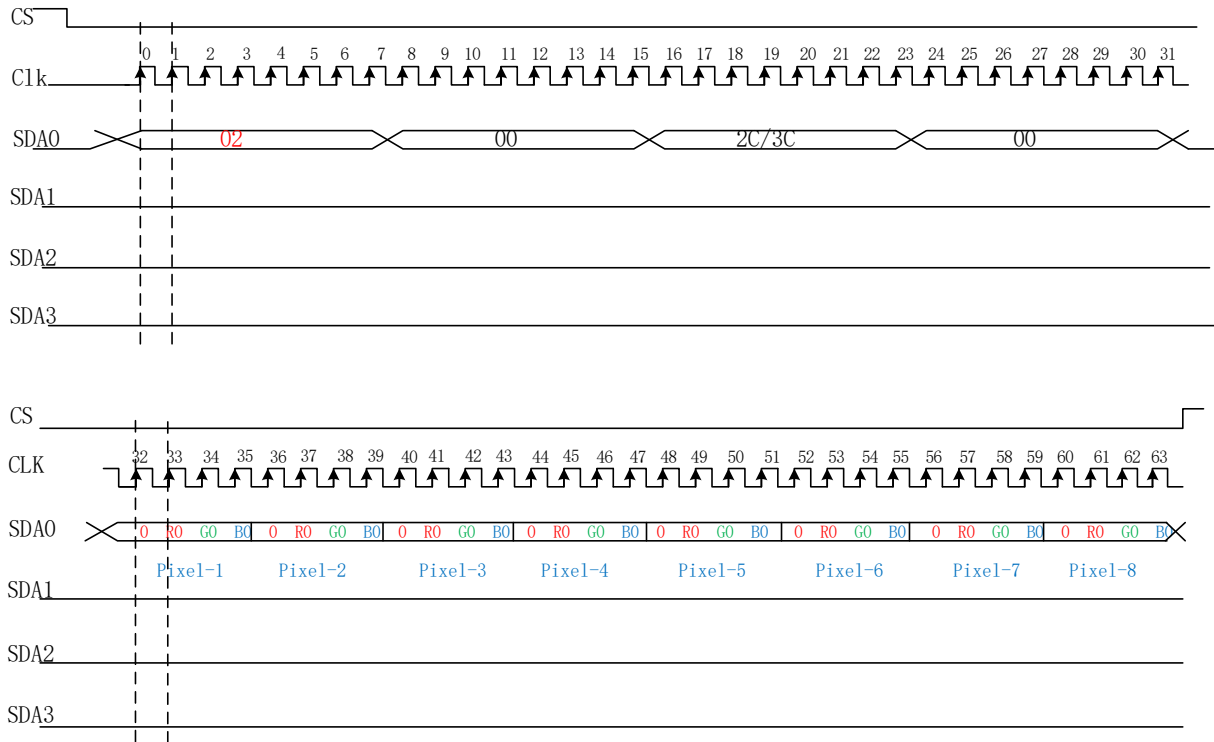

4) 256-Colors:8-bit/pixel (RGB 3, 3, 2 -bits input).

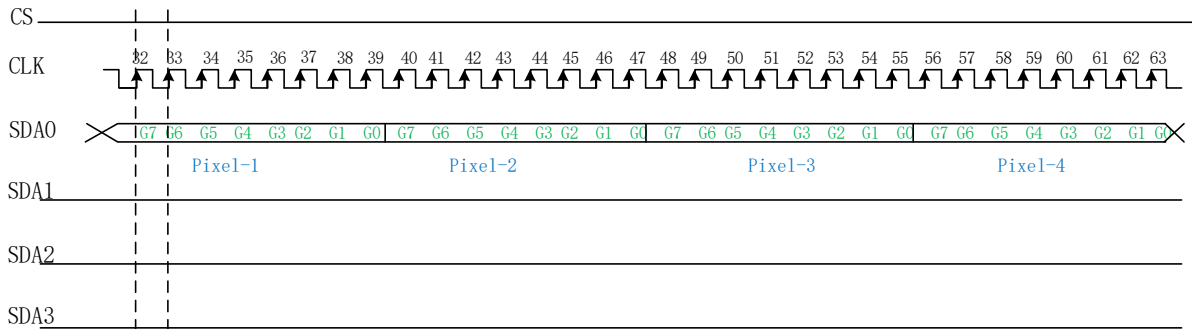

5) **8-Colors:3-bit/pixel (RGB 1, 1, 1 -bits input).**

RGB111

6) **256gray (data: bin0~bin11111111).**

Gray256

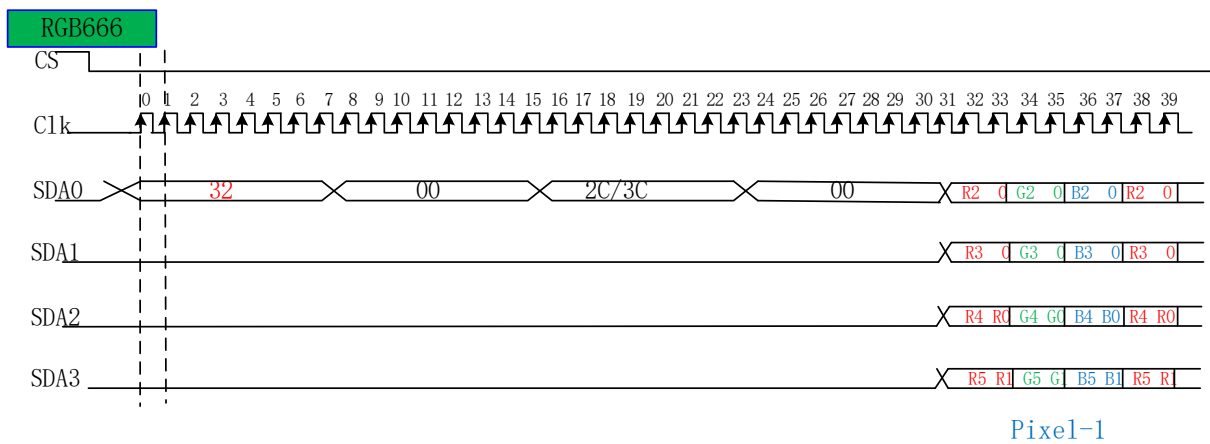

4wire data 1wire Addr: first byte=0x32

1) 16.7M-Colors:24-bit/pixel (RGB 8, 8, 8 -bits input).

6) 256gray (data: bin0~bin11111111).

3.4. MIPI (Mobile Industry Processor Interface)

GC9B71 supports MIPI DSI which can be enabled or disabled by external IM [2:0] pin. GC9B71 can be accessed through one PHY lane module which communicates via two lines to a complementary part at the other side of the lane interconnects. The communication can be separated into two different levels between the MCU and GC9B71:

- Low level communication what is done on the interface level.
- High level communication what is done on the packet level.

GC9B71 uses data and clock lane differential pairs for DSI, The data lane (D0P and D0N) is used for data communication and clock lane (DKP and DKN) is used to transmit the clock signal. The Mobile Industry Processor Interface (MIPI) can be used for communication between the processor and DSI-compliant LCD driver chip. The selection of this interface is done when IM [2:0] = 110.

Low Power mode means that each line of the differential pair is used in single end mode and a differential receiver is disabled (A termination resistor of the receiver is disabled) and it can be driven into a low power mode. High Speed mode means that differential pairs (The termination resistor of the receiver is enabled) are not used in the single end mode.

There are used different modes and protocols in each mode when there are wanted to transfer information from the MCU to GC9B71 and vice versa.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair are defined below.

Lane pair state code	Line DC Voltage Levels		High Speed	Low Power	
	D0_P	D0_N	Burst mode	DK_P	DK_N
HS-0	Low(HS)	High(HS)	Differential-0	Note 1	Note 1
HS-1	High (HS)	Low (HS)	Differential-1	Note 1	Note 1
LP-00	Low(LP)	Low(LP)	Not define	Bridge	Space
LP-01	Low(LP)	High(LP)	Not define	HS-Request	Mark-0
LP-10	High(LP)	Low(LP)	Not define	LP-Request	Mark-1
LP-11	High(LP)	High(LP)	Not define	Stop	Note 2

Notes: (1) Low-Power Receivers (LP-Rx) of the lane pair are checking the LP-00 state code, when the Lane Pair

is in the High Speed (HS) mode.

- (2) If Low-Power Receivers (LP-Rx) of the lane pair recognizes LP-11 state code, the lane pair returns to LP-11 of the Control Mode.

3.4.1. Interface Level Communication – Clock Lanes

DK_P/N lanes can be driven into three different power modes:

- Low Power Mode (LPM)
- Ultra Low Power Mode (ULPM)
- High Speed Clock Mode (HSCM)

Clock lanes are in a single end mode (LP = Low Power) when there is entering or leaving Low Power Mode (LPM) or Ultra Low Power Mode (ULPM).

Clock lanes are in the single end mode (LP = Low Power) when there is entering in or leaving out High Speed Clock Mode (HSCM).

These entering and leaving protocols are using clock lanes in the single end mode to generate an entering or leaving sequences.

The principal flow chart of the different clock lanes power modes is illustrated below.

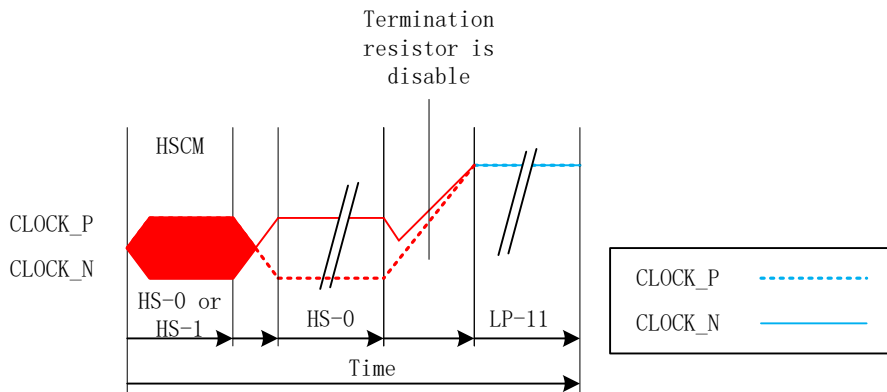

3.4.1.1. Low Power Mode (LPM)

DK_P/N lanes can be driven to the Low Power Mode (LPM), when DK lanes are entering LP-11 State Code, in three different ways:

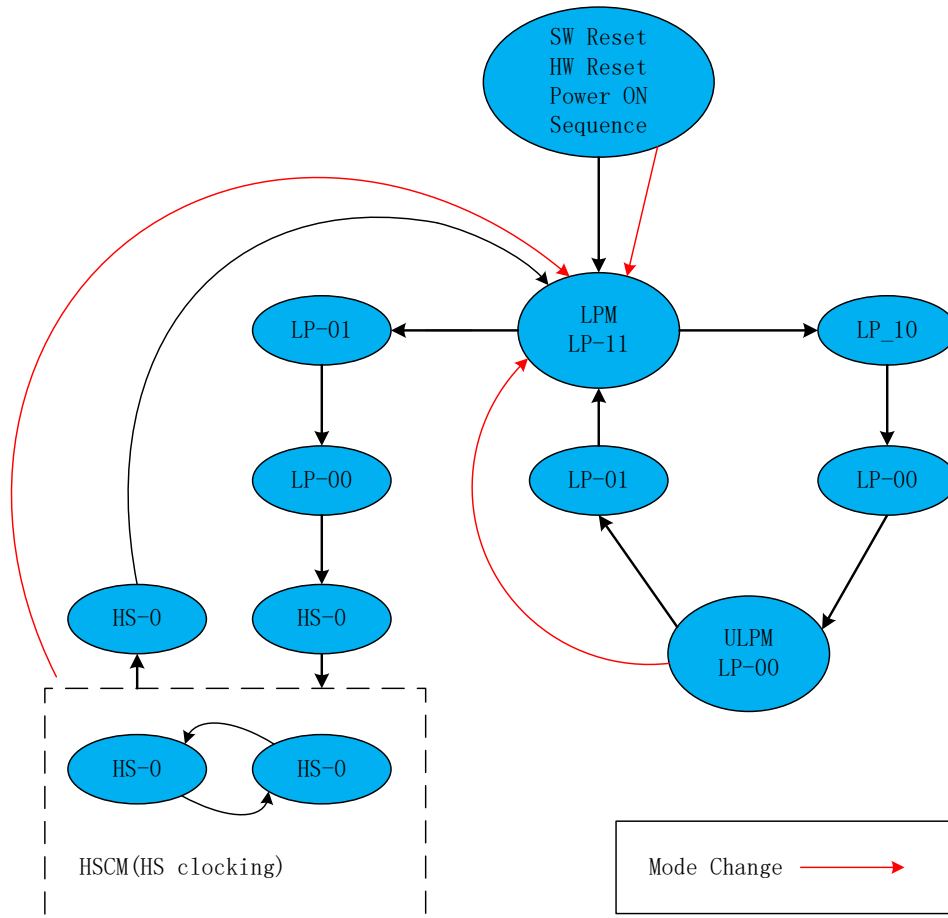

- 1) After SW Reset, HW Reset or Power On Sequence =>LP-11
- 2) After DK_P/N lanes are leaving Ultra Low Power Mode (ULPM, LP-00 State Code) =>LP-10 =>LP-11 (LPM). This sequence is illustrated below.

- 3) After DSI-CLK+/- lanes are leaving High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) =>HS-0 =>LP-11 (LPM). This sequence is illustrated below.

All three mode changes are illustrated a flow chart below.

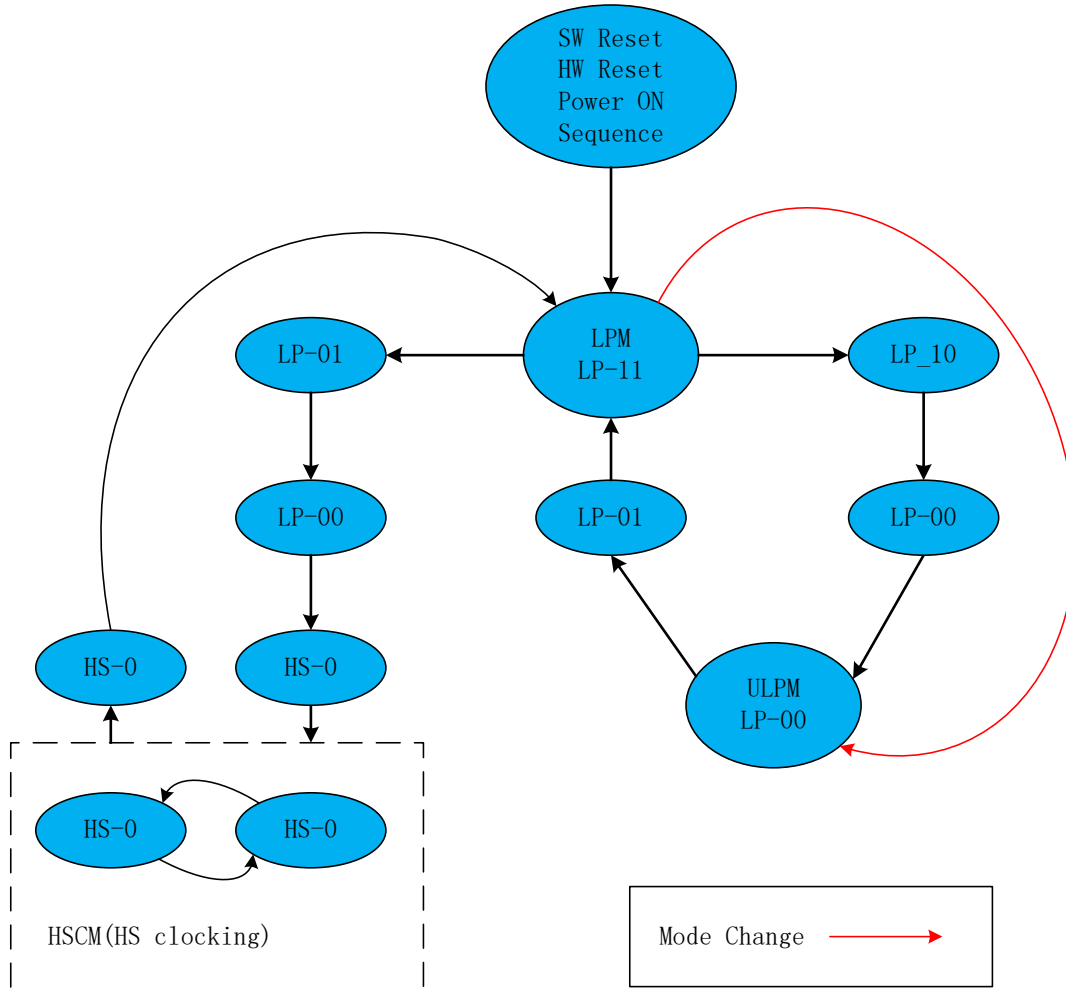

3.4.1.2 Ultra Low Power Mode (ULPM)

DK_P/N lanes can be driven to the Ultra Low power Mode (ULPM), when DK lanes are entering LP-00 State Code.

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-10 =>LP-00 (ULPM). This sequence is illustrated below

The mode change is also illustrated below.

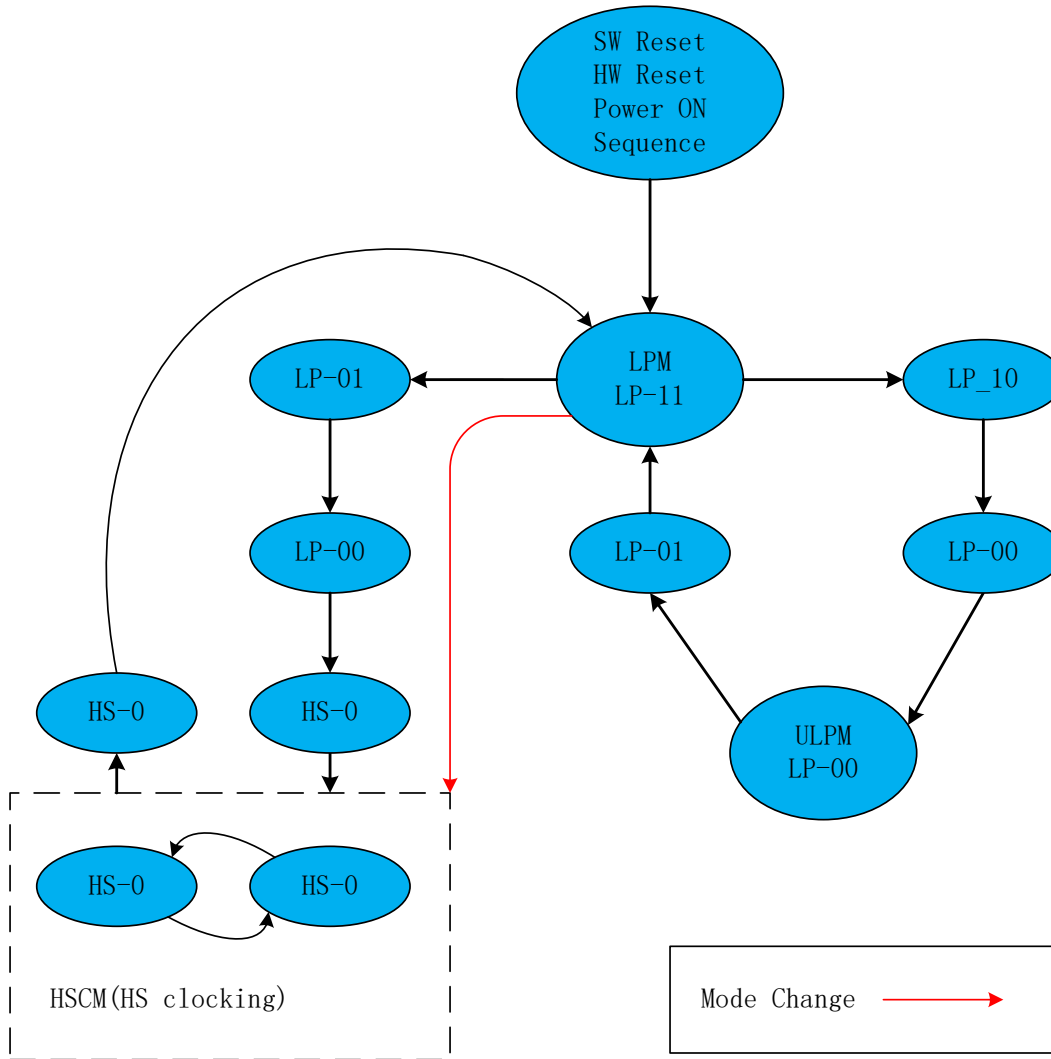

3.4.1.3. High-Speed Clocked Mode (HSCM)

DK_P/N lanes can be driven to the High Speed Clock Mode (HSCM), when DK lanes are starting to work between HS-0 and HS-1 State Codes.

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-01 =>LP-00 =>HS-0 =>HS-0/1 (HSCM). This sequence is illustrated below.

The mode change is also illustrated below.

The high speed clock (DK_P/N) is started before high speed data is sent via DK_P/N lanes. The high speed clock continues clocking after the high speed data sending has been stopped. The burst of the high speed clock consists of:

- Even number of transitions
- Start state is HS-0
- End state is HS-0

- Notes: 1. If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.
 2. If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.

3.4.2. Interface Level Communication – Data Lanes

D0_P/N Data Lanes can be driven in different modes which are:

- Escape Mode
- High-Speed Data Transmission
- Bus Turnaround Request

These modes and their entering codes are defined on the following table.

Mode	Entering Mode Sequence	Leaving Mode Sequence
Escape Mode	LP-11 → LP-10 → LP-00 → LP-01 → LP-00	LP-00 → LP-10 → LP-11 (Mark-1)
High-Speed Data Transmission	LP-11 → LP-01 → LP-00 → HS-0	(HS-0 or HS-1) → LP-11
Bus Turnaround Request	LP-11 → LP-10 → LP-00 → LP-10 → LP-00	Hi-Z

3.4.2.1 Escape Modes

Data lanes (D0_P/N) can be used in different Escape Modes when data lanes are in Low Power (LP) mode.

These Escape Modes are used to:

- Send “Low-Power Data Transmission” (LPDT) e.g. from the MCU to GC9B71,
- Drive data lanes to “Ultra-Low Power State” (ULPS),
- Indicate “Remote Application Reset” (RAR), which is resetting GC9B71,
- Indicate “Tearing Effect” (TEE), which is used for a TE line event from GC9B71 to the MCU,
- Indicate “Acknowledge” (ACK), which is used for a non-error event from GC9B71 to the MCU

The basic sequence of the Escape Mode is as follow:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Escape Command (EC), which is coded, when one of the data lanes is changing from low-to-high-to-low then this changed data lane is presenting a value of the current data bit (DSI-DATA_P = 1, DSI-DATA_N = 0) e.g. When DSI-DATA_N is changing from low-to-high-to-low, the receiver is latching a data bit, which value is logical 0. The receiver is using this low-to-high-to-low transition for its internal clock.
- A load if it is needed
- Exit Escape (Mark-1) LP-00 =>LP-10 =>LP-11
- End: LP-11

This basic construction is illustrated below:

There are a total of eight Escape Command(EC) divided into two types, Modes and Triggers(see below table). An example of a Mode type Escape Command is “Ultra-Low Power Mode” where the MCU instructs the display module to enter it’s Ultra-Low Power Mode.

An example of Trigger type Escape Command is ‘Tearing Effect’. In this case the MCU has already instructed .The display module to provide this trigger and is waiting for the response. The display module then sends a TE Trigger(TEE) on the next V-sync event.

Escape commands are defined on the next table.

Escape command	Command Type Mode / Trigger	Entry command Pattern (First to Last Bit Transmitted)
Low-Power Data Transmission	Mode	1110 0001
Ultra-Low Power Mode	Mode	0001 1110
Undefined-1, Note	Mode	1001 1111
Undefined-2, Note	Mode	1101 1110
Remote Application Reset	Trigger	0110 0010
Tearing Effect	Trigger	0101 1101
Acknowledge	Trigger	0010 0001
Uknown-5, Note	Trigger	1010 0000

Note: This Escape command support has not been implemented on GC9B71.

3.4.2.1.1. Low-Power Data Transmission (LPDT)

The MCU can send data to GC9B71 in Low-Power Data Transmission (LPDT) mode when data lanes are entering in Escape Mode and Low-Power Data Transmission (LPDT) command has been sent to GC9B71. GC9B71 is also using the same sequence when it is sending data to the MCU.

The Low Power Data Transmission (LPDT) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Low-Power Data Transmission (LPDT) command in Escape Mode: 1110 0001 (First to Last bit)
- Load (Data):
 - ◆ One or more bytes (8 bit)
 - ◆ Data lanes are in pause mode when data lanes are stopped (Both lanes are low) between bytes
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

Note: Load (Data) is presenting that the first bit is logical ‘1’ in this example.

3.4.2.1.2. Ultra-Low Power State (ULPS)

The MCU can force data lanes in Ultra-Low Power State (ULPS) mode when data lanes are entering in Escape Mode.

The Ultra-Low Power State (ULPS) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Ultra-Low Power State (ULPS) command in Escape Mode: 0001 1110 (First to Last bit)
- Ultra-Low Power State (ULPS) when the MCU is keeping data lanes low
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

3.4.2.1.3. Remote Application Reset (RAR)

The MCU can inform to GC9B71 that it should be reset in Remote Application Reset (RAR) trigger when data lanes are entering in Escape Mode.

The Remote Application Reset (RAR) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Remote Application Reset (RAR) command in Escape Mode: 0110 0010 (First to Last bit)

- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11
- This sequence is illustrated for reference purposes below:

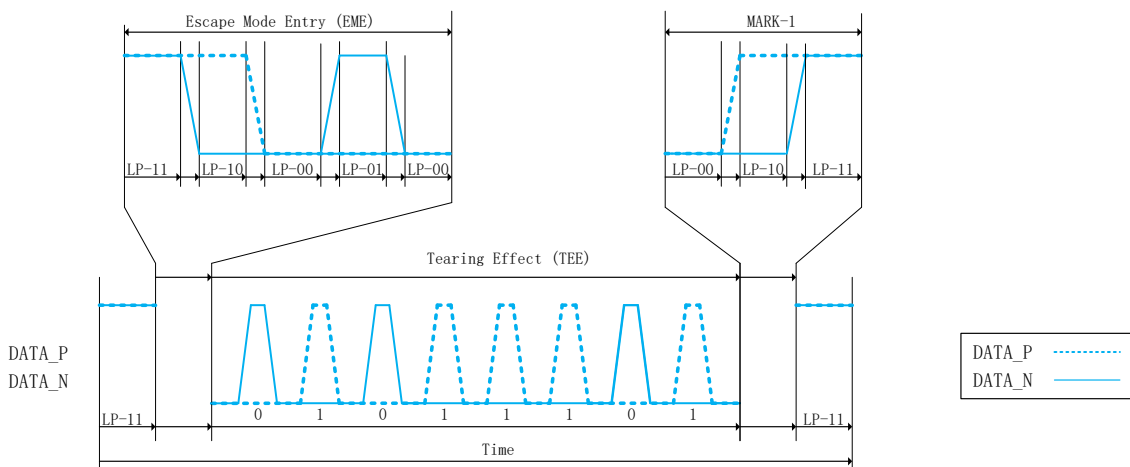

3.4.2.1.4. Tearing Effect (TEE)

GC9B71 can inform to the MCU when a tearing effect event (New V-synch) has been happen on the display module by Tearing Effect (TEE).

The Tearing Effect (TEE) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Tearing Effect (TEE) trigger in Escape Mode: 0101 1101 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

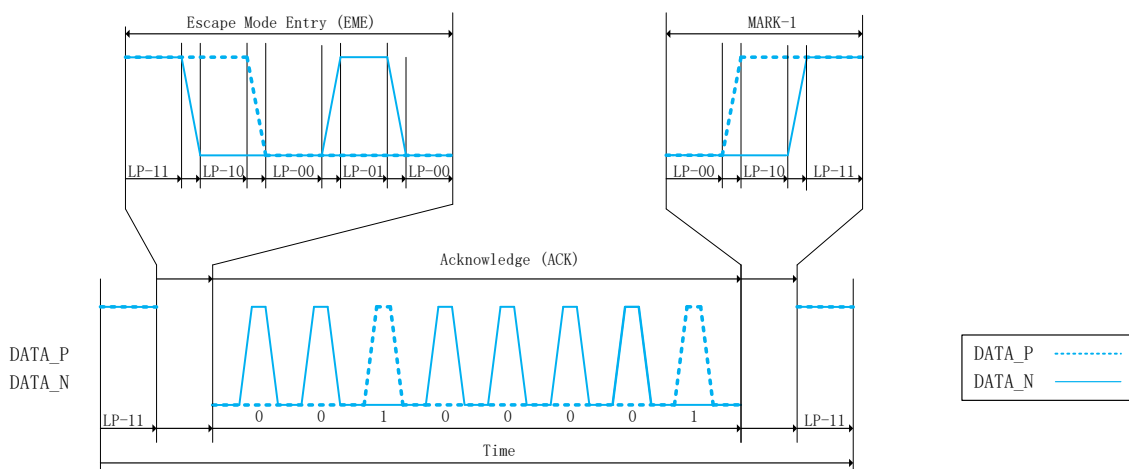

3.4.2.1.5. Acknowledge (ACK)

GC9B71 can inform to the MCU when an error has not recognized on it by Acknowledge (ACK).

The display module is sending the Acknowledge (ACK) what is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Acknowledge (ACK) command in Escape Mode: 0010 0001 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

3.4.2.2. High-Speed Data Transmission (HSDT)

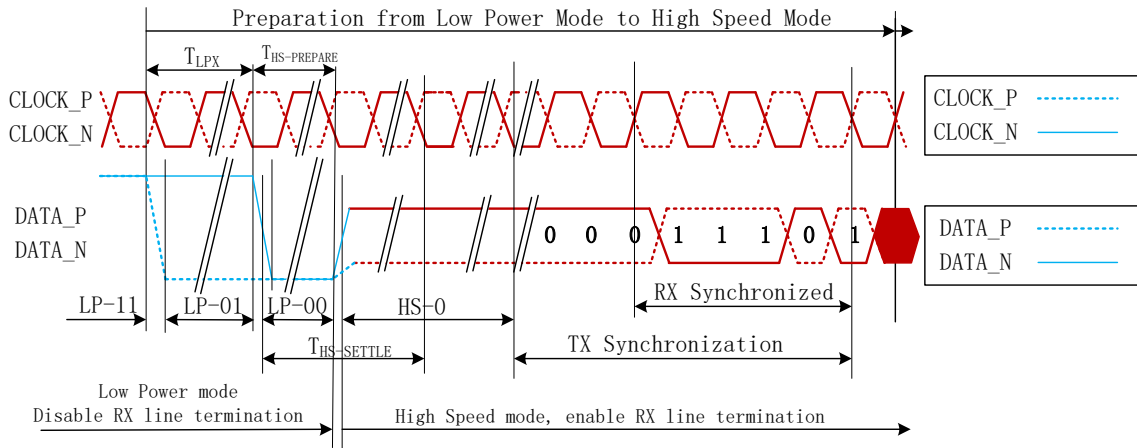

3.4.2.2.1. Entering High-Speed Data Transmission (TSOT of HSDT)

GC9B71 is entering High-Speed Data Transmission (HSDT) when Clock lanes DK_P/N have already been entered in the High-Speed Clock Mode (HSCM) by the MCU.

Data lanes DSI-DATA_P/N of GC9B71 are entering (TSOT) in the High-Speed Data Transmission (HSDT) as follows

- Start: LP-11
- HS-Request: LP-01
- HS-Settle: LP-00 => HS-0 (Rx: Lane Termination Enable)
- Rx Synchronization: 011101 (Tx (= MCU) Synchronization: 0001 1101)
- End: High-Speed Data Transmission (HSDT) – Ready to receive High-Speed Data Load

This same entering High-Speed Data Transmission (T_{SOT} of HSDT) sequence is illustrated below:

3.4.2.2.2. Leaving High-Speed Data Transmission (T_{EOT} of HSDT)

GC9B71 is leaving the High-Speed Data Transmission (T_{EOT} of HSDT) when Clock lanes DK_P/N are in the High-Speed Clock Mode (HSCM) by the MCU and this HSCM is kept until data lanes DSI-DATA_P/N are in LP-11 mode.

Data lanes DSI-DATA_P/N of the display module are leaving from the High-Speed Data Transmission (T_{EOT} of HSDT) as follows

- Start: High-Speed Data Transmission (HSDT)
- Stops High-Speed Data Transmission
 - ◆ MCU changes to HS-1, if the last load bit is HS-0
 - ◆ MCU changes to HS-0, if the last load bit is HS-1
- End: LP-11 (Rx: Lane Termination Disable)

This same leaving High-Speed Data Transmission (T_{EOT} of HSDT) sequence is illustrated below

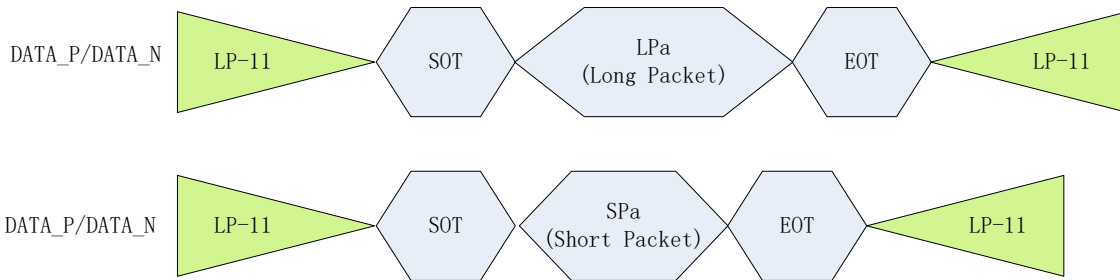

- Note: 1. If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.
 2. If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.

3.4.2.2.3. Burst of the High-Speed Data Transmission (HSDT)

The burst of the high-speed data transmission (HSDT) can consist of one data packet or several data packets. These data packets can be Long (LPa) or Short (SPa) packets. These packets are defined on chapter “4.3.3.1 Short Packet (SPa) and Long Packet (LPa) Structures”.

The single packet in High-Speed Data Transmission is illustrated for reference purposes below:

The multiple packets in High-Speed Data Transmission are illustrated for reference purposes below:

Abbreviation	Explanation
EOT	End of the Transmission
LPa	Long Packet
LP-11	Low Power Mode, Both of Data lanes are ‘1’s (Stop Mode)
SPa	Short Packet
SOT	Start of the Transmission

3.4.2.3. Bus Turnaround (BTA)

The MCU or GC9B71, which is controlling DSI-DATA_P/N Data Lanes, can start a bus turnaround procedure when it wants information from a receiver, which can be the MCU or GC9B71. The MCU and GC9B71 are using the same sequence when this bus turnaround procedure is used. This sequence is described for reference purposes, when the MCU wants to do the bus turnaround procedure to GC9B71, as follows.

- Start (MCU): LP-11
- Turnaround Request (MCU): LP-11 =>LP-10 =>LP-00=>LP-10=>LP-00
- The MCU waits until GC9B71 is starting to control DSI-DATA_P/N data lanes and the MCU stops to control DSI-DATA_P/N data lanes (= High-Z)

- GC9B71 changes to the stop mode: LP-00 =>LP-10 =>LP-11

The same bus turnaround procedure (From the MCU to GC9B71) is illustrated below:

3.4.3. Packet Level Communication

3.4.3.1. Short Packet and Long Packet Structures

Short Packet (SPa) and Long Packet (LPa) are always used when data transmission is done in Low Power Data Transmission (LPDT) or High-Speed Data Transmission (HSDT) modes.

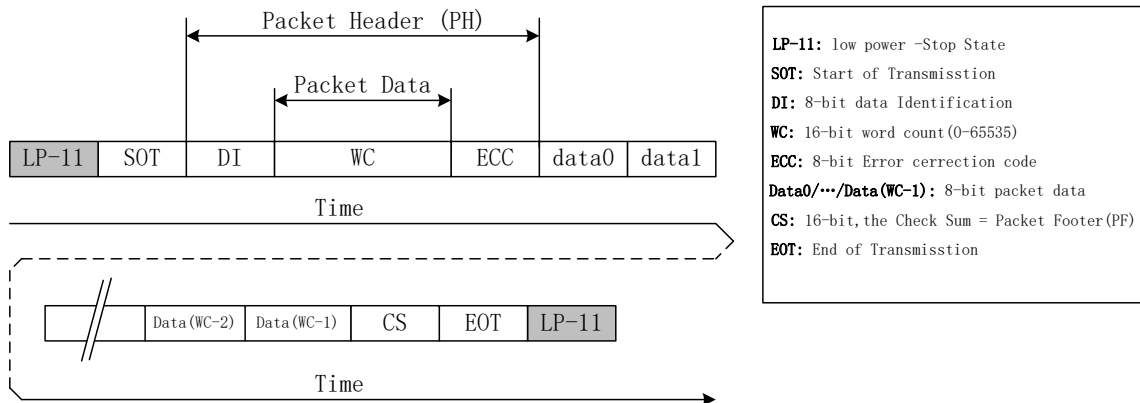

The lengths of the packets are:

- Short Packet (SPa): 4 bytes
- Long Packet (LPa): From 6 to 65,541 bytes

The type (SPa or LPa) of the packet can be recognized from their package headers (PH). The Short Packet structure is illustrated as below:

The Long Packet structure is illustrated as below:

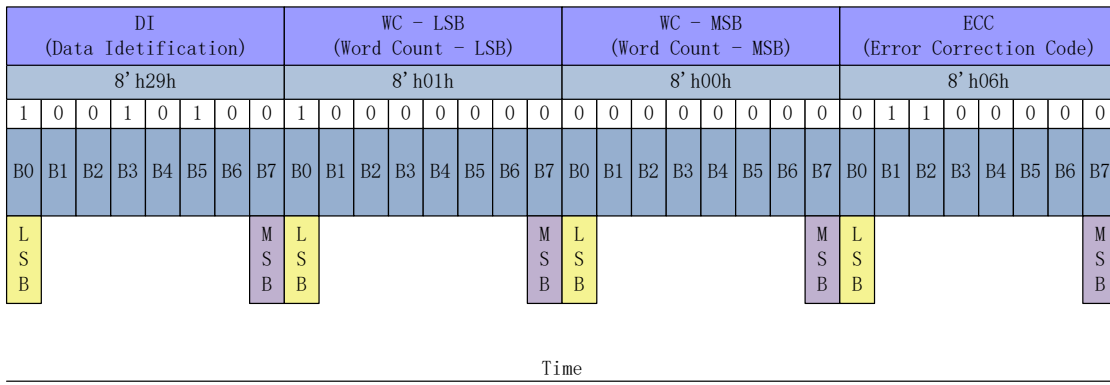

The other possibility is that there is not needed SOT, EOT and LP-11 between packets if packets have sent in multiple packet format e.g.

- LP-11 =>SOT =>SPa =>LPa =>SPa =>SPa =>EOT =>LP-11
- LP-11 =>SOT =>SPa =>SPa =>SPa =>EOT =>LP-11
- LP-11 =>SOT =>LPa =>LPa =>LPa =>EOT =>LP-11

3.4.3.1.1. Bit Order of the Byte on Packets

The bit order of the byte, what is used on packets, is that the Least Significant Bit (LSB) of the byte is sent in the first and the Most Significant Bit (MSB) of the byte is sent in the last.

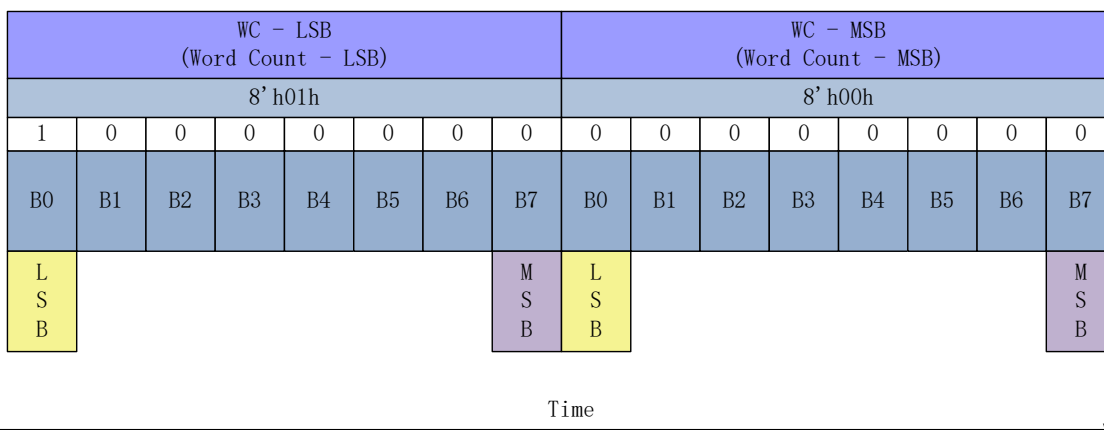

This same order is illustrated for reference purposes below.

3.4.3.1.2. Byte Order of the Multiple Byte Information on Packets

Byte order of the multiple bytes information, what is used on packets, is that the Least Significant (LS) Byte of the information is sent in the first and the Most Significant (MS) Byte of the information is sent in the last e.g. Word Count (WC) consists of 2 bytes (16 bits) when the LS byte is sent in the first and the MS byte is sent in the last.

This same order is illustrated for reference purposes below.

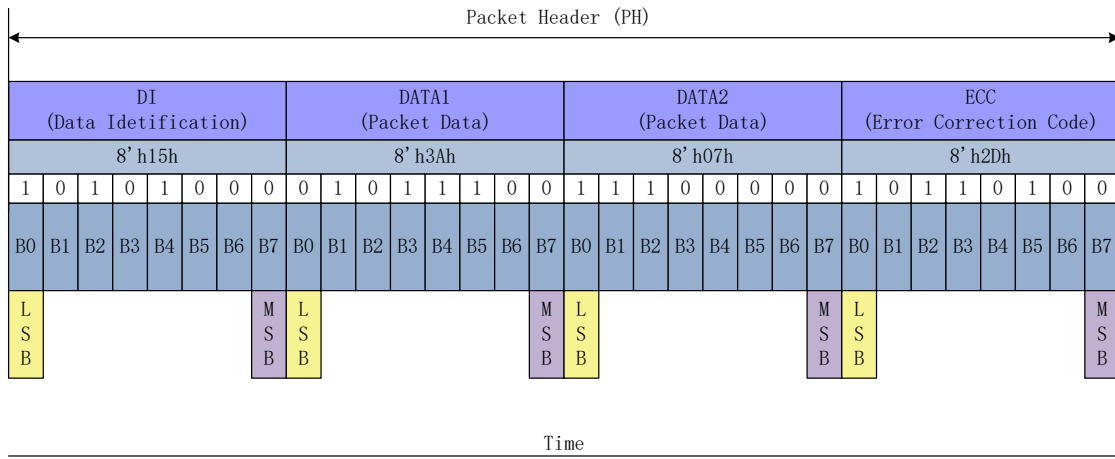

3.4.3.1.3. Packet Header (PH)

The packet header is always consisting of 4 bytes. The content of these 4 bytes are different if it is used to Short Packet (SPa) or Long Packet (LPa).

Short Packet (SPa):

- 1st byte: Data Identification (DI) => Identification that this is Short Packet (SPa)
- 2nd and 3rd bytes: Packet Data (PD), Data 0 and 1
- 4th byte: Error Correction Code (ECC)

3.4.3.1.4. Data Identification (DI)

Data Identification (DI) is a part of Packet Header (PH) and it consists of 2 parts:

- Virtual Channel (VC), 2 bits, DI [7...6]
- Data Type (DT), 6 bits, DI [5...0]

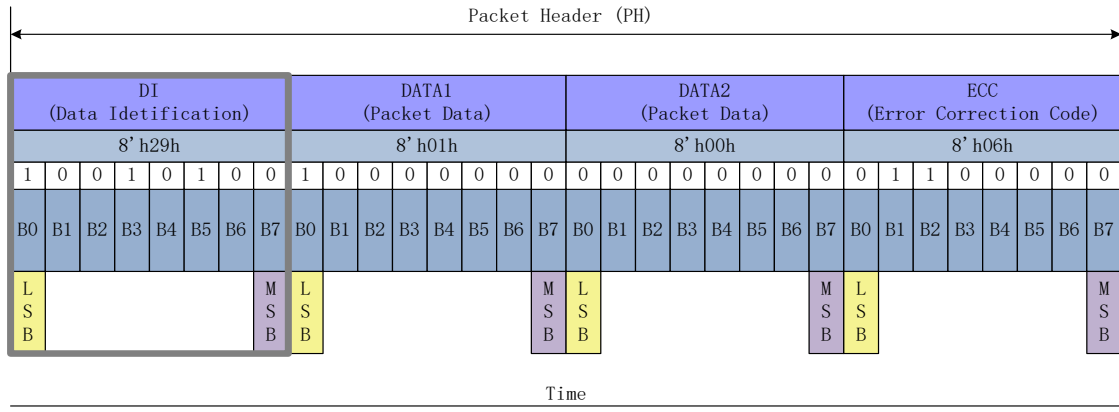

The Data Identification (DI) structure is illustrated on a diagram below.

GC9B71 Datasheet

Virture
Channel
Identifier (VC)

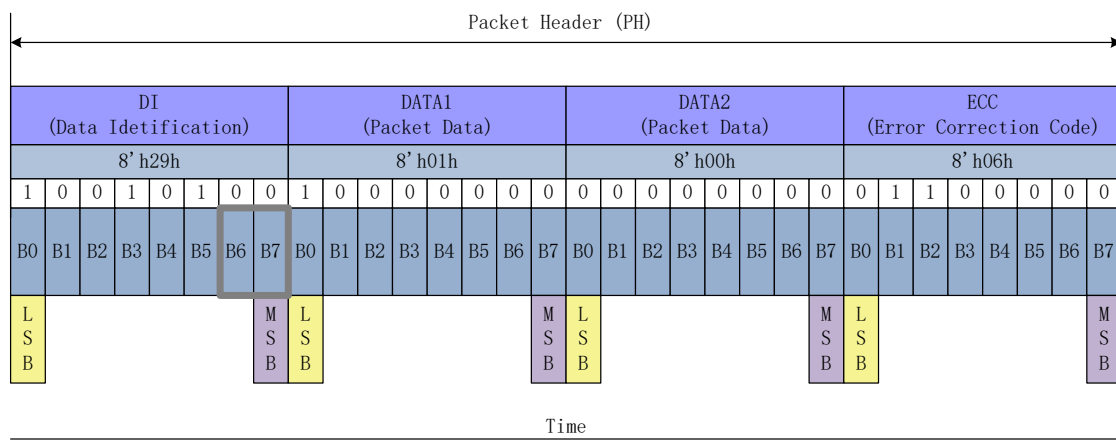

Data Type
(DT)

3.4.3.1.4.1. Virtual Channel (VC)

A processor may service up to four peripherals with tagged commands or blocks of data, using the Virtual Channel ID field of the header for packets targeted at different peripherals. The Virtual Channel ID enables one serial stream to service two or more virtual peripherals by multiplexing packets onto a common transmission channel. Note that packets sent in a single transmission each have their own Virtual Channel assignment and can be directed to different peripherals.

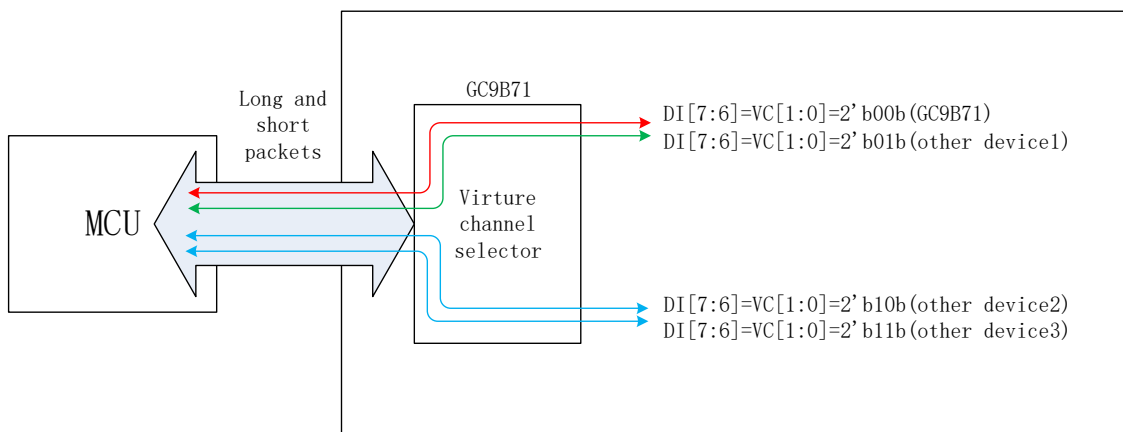

Virtual Channel (VC) is a part of Data Identification (DI [7..6]) structure and it is used to address where a packet is wanted to send from the MCU. Bits of the Virtual Channel (VC) are illustrated for reference purposes below.

Virtual Channel (VC) can address 4 different channels for e.g. 4 different display modules. Devices are using the same virtual channel what the MCU is using to send packets to them e.g.

- The MCU is using the virtual channel 0 when it sends packets to this display module
- This display module is also using the virtual channel 0 when it sends packets to the MCU

This functionality is illustrated below.

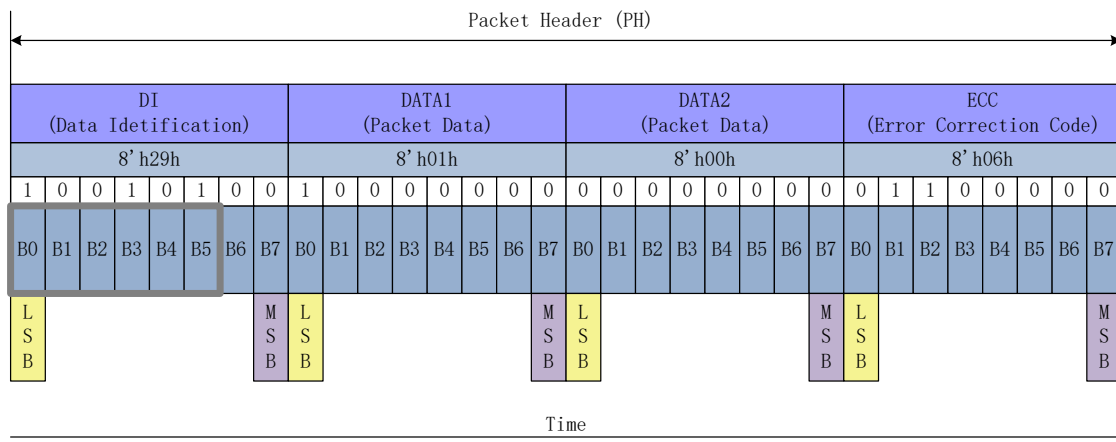

Virtual Channel (VC) is always 0 (DI[7..6]=VC[1..0]=00b) when the MCU is sending "End of Transmission Packet" to the display module.

3.4.3.1.4.2. Data Type (DT)

The Data Type field specifies if the packet is a Long or Short packet type and the packet format. The Data Type field, along with the Word Count Field for Long Packets, informs the receiver of how many bytes to expect in the remainder of the packet. This is necessary because there are no special packet start/end sync codes to indicate the beginning and end of a packet. This permits packets to convey arbitrary data, but it also requires the packet header to explicitly specify the size of the packet.

When the receiving logic has counted down to the end of a packet, it shall assume the next data is either the header of a new packet or the EoT (End of Transmission) sequence.

Data Type (DT) is a part of Data Identification (DI [5...0]) structure and it is used to define a type of the used data on a packet. Bits of the Data Type (DT) are illustrated for reference purposes below.

This Data Type (DT) also defines what the used packet is: Short Packet (SPa) or Long Packet (LPa). Data Types (DT) are different from the MCU to the display module (or other devices) and vice versa. These Data Type (DT) are defined on tables below

From the MCU to GC9B71									
B5	B4	B3	B2	B1	B0	Hex	Description	Short/Long Packet	Abbreviation
0	0	1	0	0	0	08	End of Transmission Packet, Note1	SPa (Short Packet)	EOTP
0	0	0	1	0	1	05	DCS Write, No Parameter	SPa (Short Packet)	DCSWN-S
0	1	0	1	0	1	15	DCS Write, 1 Parameter	SPa (Short Packet)	DCSW1-S
0	0	0	1	1	0	06	DCS Read, No Parameter	SPa (Short Packet)	DCSRN-S
1	1	0	1	1	1	37	Set Maximum Return Packet Size	SPa (Short Packet)	SMRPS-S
0	0	1	0	0	1	09	Null Packet, No Data, Note2	LPa (Long Packet)	NP-L
1	1	1	0	0	1	39	DCS Write Long	LPa (Long Packet)	DCSW-L

Notes: 1. This can be used when the MCU wants to secure that there is the end of the transmission in High Version 1.0

Speed Data Transferring (HSDT) mode.

2. This can be used when data lanes are wanted to keep in High Speed Data Transferring (HSDT) Mode.
3. The receiver is ignored other Data Type (DT) if they are not defined on tables.

From the GC9B71 to MCU									
B5	B4	B3	B2	B1	B0	Hex	Description	Short/Long Packet	Abbreviation
0	0	0	0	1	0	02	Acknowledge with Error Report	SPa (Short Packet)	AwER
0	1	1	1	0	0	1C	DCS Read Long Response	LPa (Long Packet)	DCSRR-L
1	0	0	0	0	1	21	DCS Read Short Response, 1 byte returned	SPa (Short Packet)	DCSRR1-S
1	0	0	0	1	0	22	DCS Read Short Response, 2 byte returned	SPa (Short Packet)	DCSRR2-S

Notes: 1. The receiver is ignored other Data Type (DT) if they are not defined on tables.

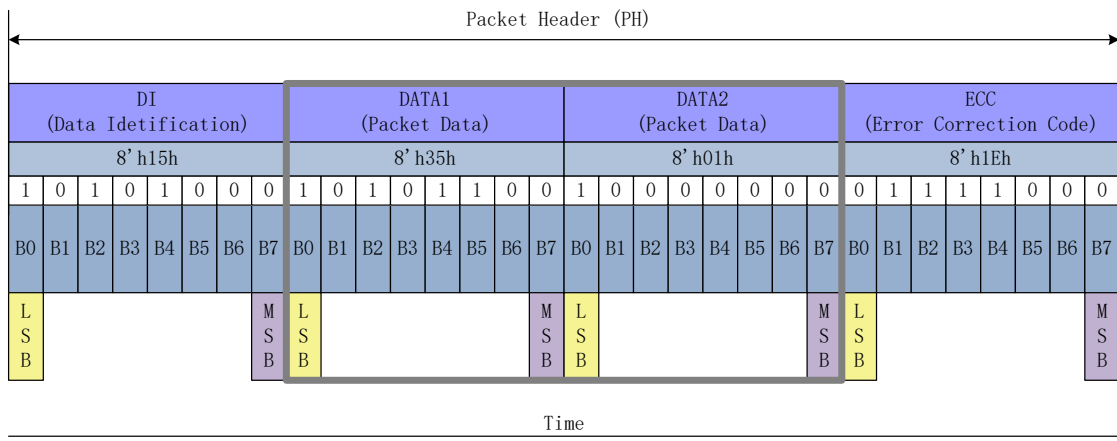

3.4.3.1.4.3. Packet Data on the Short Packet

Packet Data (PD) of the Short Packet (SPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Short Packet (SPa) is wanted to send. Packet Data (PD) of the Short Packet (SPa) consists of 2 data bytes: Data 0 and Data 1. Packet Data (PD) sending order is that Data 0 is sent in the first and the Data 1 is sent in the last. Bits of Data 1 are set to '0' if the information length is 1 byte.

Packet Data (PD) of the Short Packet (SPa), when the length of the information is 1 or 2 bytes are illustrated for reference purposes below, when Virtual Channel (VC) is 0.

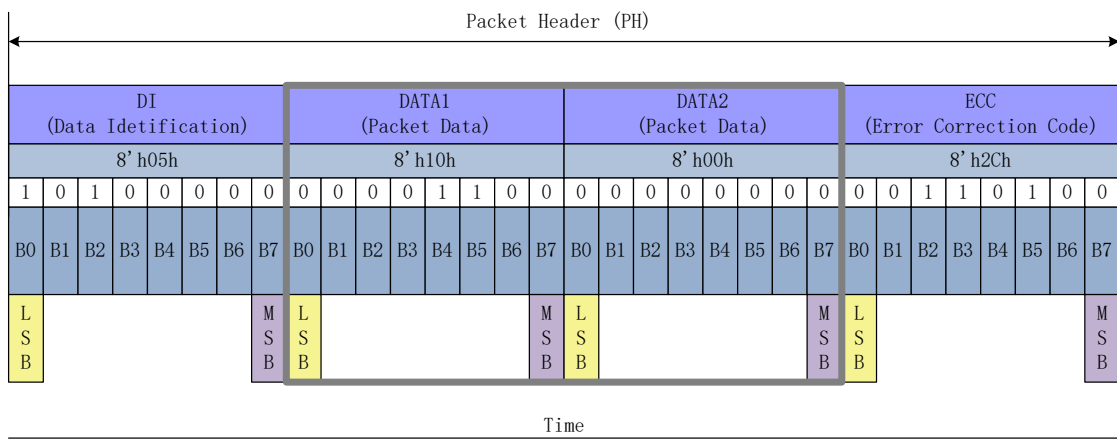

Packet Data (PD) information:

- Data 0: 35hex (Display Command Set (DCS) with 1 Parameter => DI (Data Type (DT)) = 15hex)
- Data 1: 01hex (DCS's parameter)

Packet Data (PD) information:

- Data 0: 10hex (DCS without parameter => DI (Data Type (DT)) = 05hex)
- Data 1: 00hex (Null)

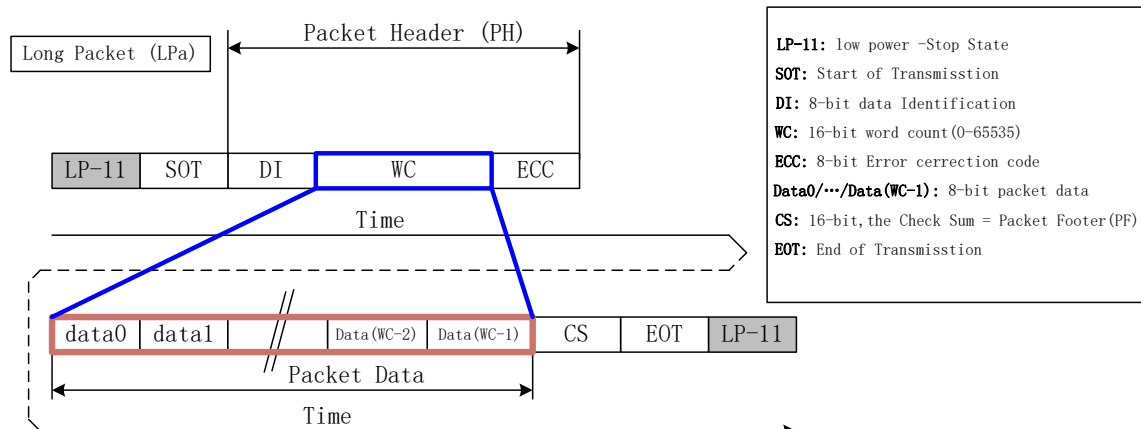

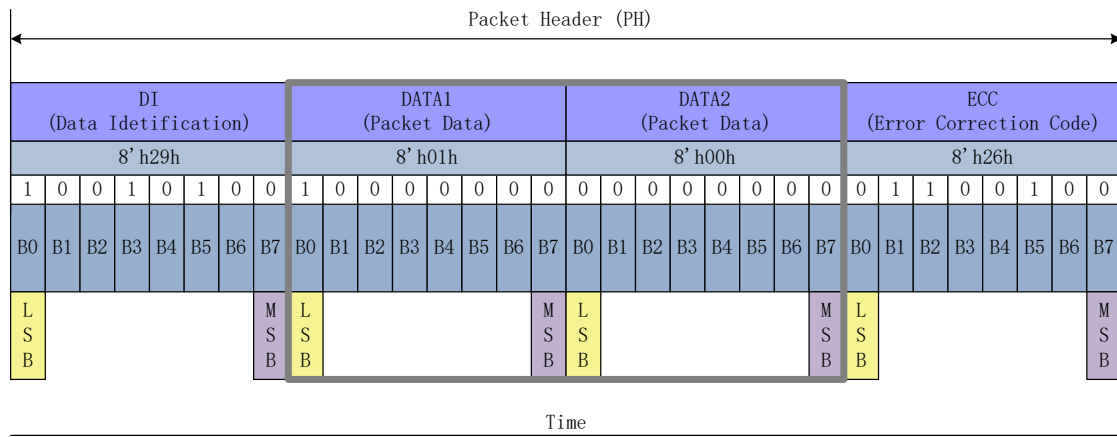

3.4.3.1.4.4. Word Count on the Long Packet

Word Count (WC) of the Long Packet (LPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Long Packet (LPa) is wanted to send.

Word Count (WC) indicates a number of the data bytes of the Packet Data (PD) what is wanted to send after Packet Header (PH) versus Packet Data (PD) of the Short Packet (SPa) are placed in the Packet Header (PH). Word Count (WC) of the Long Packet (LPa) consists of 2 bytes.

These 2 bytes of the Word Count (WC) sending order is that the Least Significant (LS) Byte is sent in the first and the Most Significant (MS) Byte is sent in the last.

Word Count (WC) of the Long Packet (LPa) is illustrated for reference purposes below.

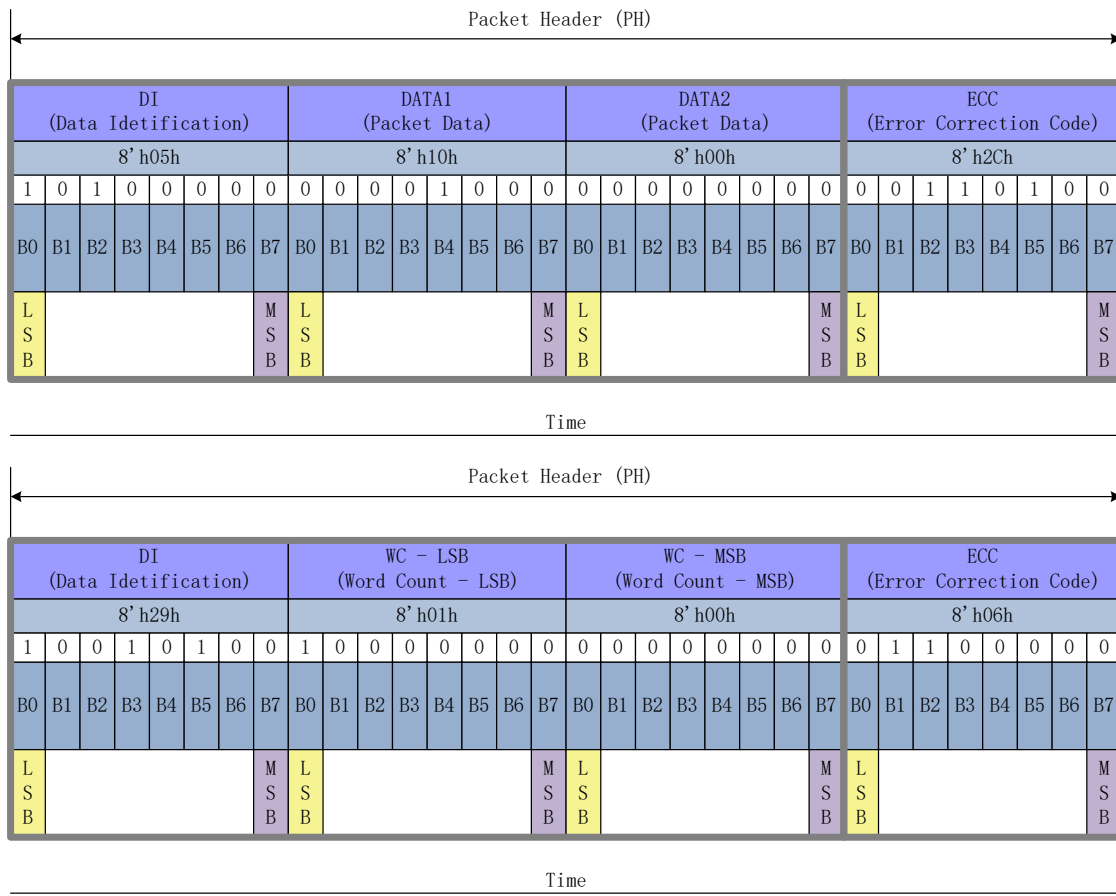

3.4.3.1.4.5. Error Correction Code (ECC)

The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header. The host processor shall always calculate and transmit an ECC byte and GC9B71 supports ECC in both forward- and reverse-direction communications.

Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors:

- Short Packet (SPa): Data Identification (DI) and Packet Data (PD) bytes (24 bits: D [23...0])
- Long Packet (LPa): Data Identification (DI) and Word Count (WC) bytes (24 bits: D [23...0])

D [23...0] is illustrated for reference purposes below.

Error Correction Code (ECC) can recognize one error or several errors and makes correction in one bit error case.

Bits (P[7...0]) of the Error Correction Code (ECC) are defined, where the symbol ‘^’ is presenting XOR function (Pn is ‘1’ if there is odd number of ‘1’s and Pn is ‘0’ if there is even number of ‘1’s), as follows.

- P7 = 0
- P6 = 0
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23
- P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22

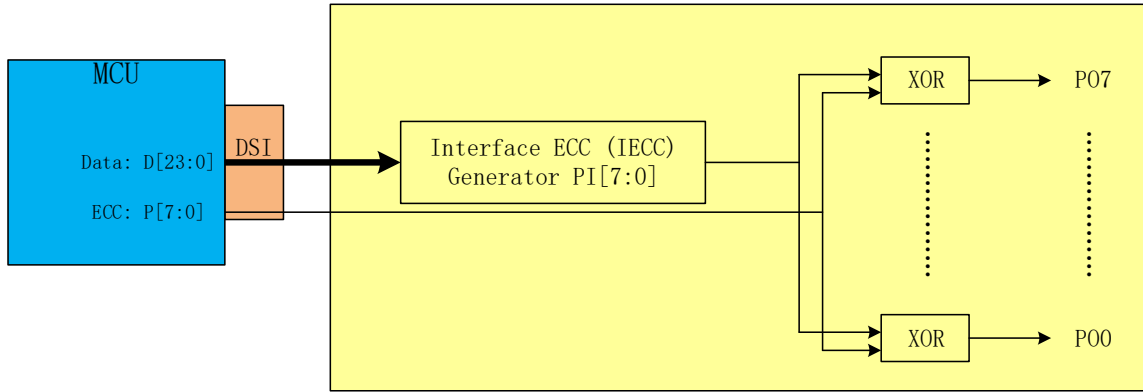

GC9B71 Datasheet

- $P1 = D0 \wedge D1 \wedge D3 \wedge D4 \wedge D6 \wedge D8 \wedge D10 \wedge D12 \wedge D14 \wedge D17 \wedge D20 \wedge D21 \wedge D22 \wedge D23$
- $P0 = D0 \wedge D1 \wedge D2 \wedge D4 \wedge D5 \wedge D7 \wedge D10 \wedge D11 \wedge D13 \wedge D16 \wedge D20 \wedge D21 \wedge D22 \wedge D23$

P7 and P6 are set to '0' because Error Correction Code (ECC) is based on 64 bit value ([D63...0]), but this implementation is based on 24 bit value (D [23...0]). Therefore, there is only needed 6 bits (P [5...0]) for Error Correction Code (ECC).

The transmitter (The MCU or GC9B71) is sending data bits D [23...0] and Error Correction Code (ECC) P [7...0]. The receiver (GC9B71 or the MCU) is calculate an Internal Error Correction Code (IECC) and compares the received Error Correction Code (ECC) and the Internal Error Correction Code (IECC). This comparison is done when each power bit of ECC and IECC have been done XOR function. The result of this function is PO [7...0]. This functionality, where the transmitter is the MCU and the receiver is GC9B71, is illustrated for reference purposes below.

The sent data bits (D[23...0]) and ECC (P[7...0]) are received correctly, if a value of the PO[7...0]) is 00h. The sent data bits (D[23...0]) and ECC (P[7...0]) are not received correctly, if a value of the PO[7...0]) is not 00h.

ECC P[7:0]	1	1	0	0	0	0	0	0	03h
IECC PI[7:0]	1	1	0	0	0	0	0	0	03h
$(ECC) \oplus (IECC) \rightarrow PO[7:0]$	0	0	0	0	0	0	0	0	=00h → No Error
	L							M	
	S							S	
	B							B	

ECC P[7:0]	1	1	0	0	0	0	0	0	03h
IECC PI[7:0]	1	1	1	1	0	0	0	0	0Fh
$(ECC) \oplus (IECC) \rightarrow PO[7:0]$	0	0	1	1	0	0	0	0	=0Ch → Error
	L							M	
	S							S	
	B							B	

The received Error Correction Code (ECC) can be 00h when the Error Correction Code (ECC) functionality is not used for data values D[23...0] on the transmitter side. The number of the errors (one or more) can be defined when the value of the PO [7...0] is compared to values on the following table.

Data Bit	PO7	PO6	PO5	PO4	PO3	PO2	PO1	PO0	Hex
D[0]	0	0	0	0	0	1	1	1	07h
D[1]	0	0	0	0	1	0	1	1	0Bh
D[2]	0	0	0	0	1	1	0	1	0Dh
D[3]	0	0	0	0	1	1	1	0	0Eh
D[4]	0	0	0	1	0	0	1	1	13h
D[5]	0	0	0	1	0	1	0	1	15h
D[6]	0	0	0	1	0	1	1	0	16h
D[7]	0	0	0	1	1	0	0	1	19h
D[8]	0	0	0	1	1	0	1	0	1Ah
D[9]	0	0	0	1	1	1	0	0	1Ch

D[10]	0	0	1	0	0	0	1	1	23h
D[11]	0	0	1	0	0	1	0	1	25h
D[12]	0	0	1	0	0	1	1	0	26h
D[13]	0	0	1	0	1	0	0	1	29h
D[14]	0	0	1	0	1	0	1	0	2Ah
D[15]	0	0	1	0	1	1	0	0	2Ch
D[16]	0	0	1	1	0	0	0	1	31h
D[17]	0	0	1	1	0	0	1	0	32h
D[18]	0	0	1	1	0	1	0	0	34h
D[19]	0	0	1	1	1	0	0	0	38h
D[20]	0	0	0	1	1	1	1	1	1Fh
D[21]	0	0	1	0	1	1	1	1	2Fh
D[22]	0	0	1	1	0	1	1	1	37h
D[23]	0	0	1	1	1	0	1	1	3Bh

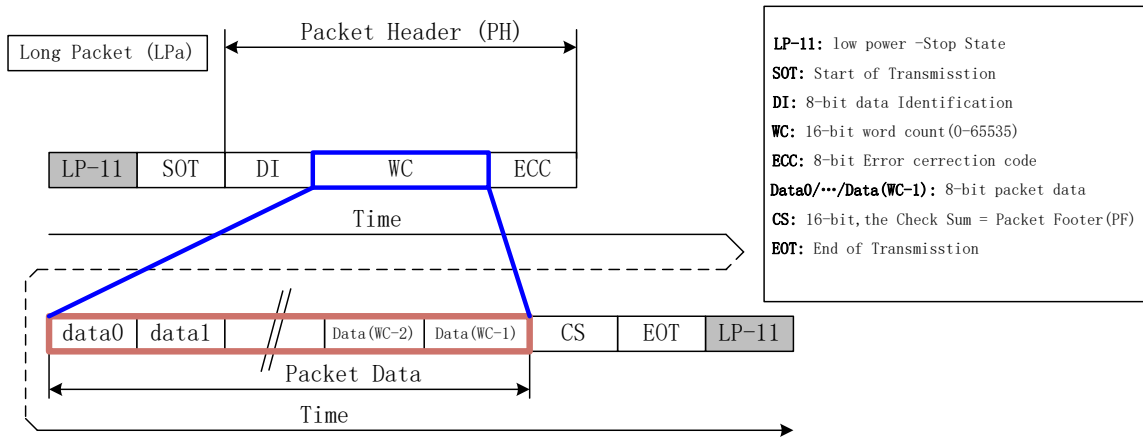

One error is detected if the value of the PO [7...0] is on the above table : One Bit Error Value of the Error Correction Code (ECC) and the receiver can correct this one bit error because this found value also defines what is a location of the corrupt bit e.g.

- PO [7...0] = 0Eh
- The bit of the data (D [23...0]), what is not correct, is D[3]

More than one error is detected if the value of the PO [7...0] is not on the above table: One Bit Error Value of the Error Correction Code (ECC) e.g. PO [7...0] = 0Ch.

3.4.3.1.4.6. Packet Data on the Long Packet

Packet Data (PD) of the Long Packet (LPa) is defined after Packet Header (PH) of the Long Packet (LPa). The number of the data bytes is illustrated as below:

3.4.3.1.4.7. Packet Footer on the Long Packet

Packet Footer (PF) of the Long Packet (LPa) is defined after the Packet Data (PD) of the Long Packet (LPa). The Packet Footer (PF) is a checksum value what is calculated from the Packet Data of the Long Packet (LPa). The checksum is using a 16-bit Cyclic Redundancy Check (CRC) value which is generated with a polynomial $X_{16}+X_{12}+X_5+X_0$ as it is illustrated below.

The 16-bit Cyclic Redundancy Check (CRC) generator is initialized to FFFFh before calculations.

The Most Significant Bit (MSB) of the data byte of the Packet Data (PD) is the first bit what is inputted into the 16-bit Cyclic Redundancy Check (CRC).

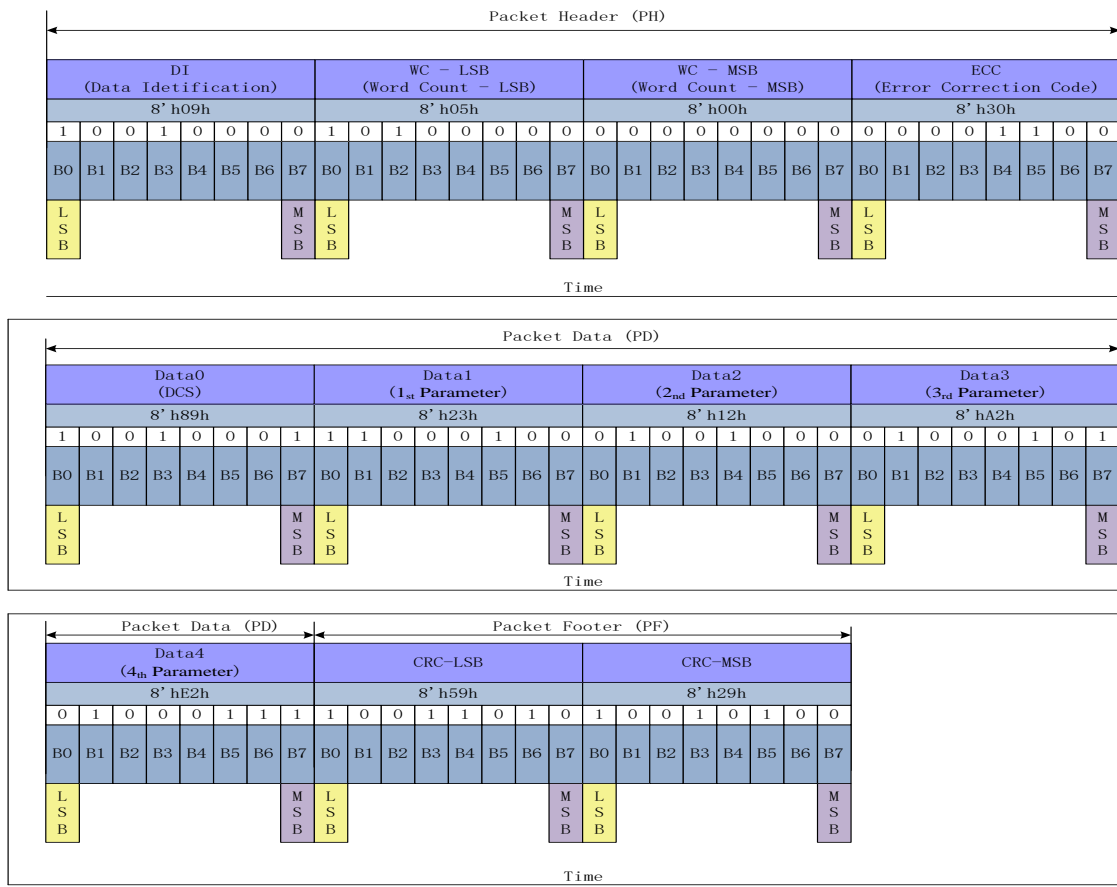

An example of the 16-bit Cyclic Redundancy Check (CRC), where the Packet Data (PD) of the Long Packet (LPa) is 01h, is illustrated (step-by-step) below.

A value of the Packet Footer (PF) is 1E0Eh in this example. This example (Command 01h has been sent) is

GC9B71 Datasheet

illustrated below.

The receiver is calculated own checksum value from received Packet Data (PD). The receiver compares own checksum and the Packet Footer (PF) what the transmitter has sent.

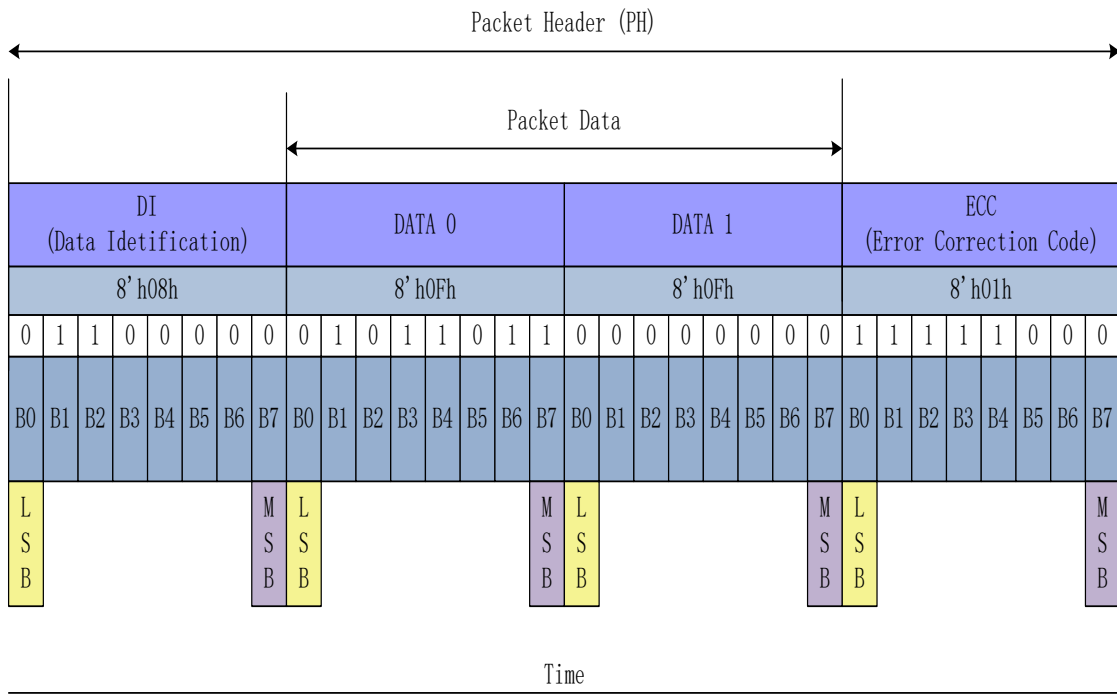

The received Packet Data (PD) and Packet Footer (PF) are correct if the own checksum of the receiver and Packet Footer (PF) is equal and vice versa the received Packet Data (PD) and Packet Footer (PF) are not correct if the own checksum of the receiver and Packet Footer (PF) are not equal.

3.5. Packet Transmissions

3.5.1. Packet form the MCU to GC9B71

3.5.1.1. Display Command Set (DCS)

Display Command Set (DCS), which is defined on next chapter, is used from the MCU to GC9B71. This Display Command Set (DCS) is always defined on the Data 0 of the Packet Data (PD), which is included in Short Packet (SPa) and Long packet (LPa) as these are illustrated as below.

3.5.1.2. Display Command Set Write, no Parameter (DCSWN-S)

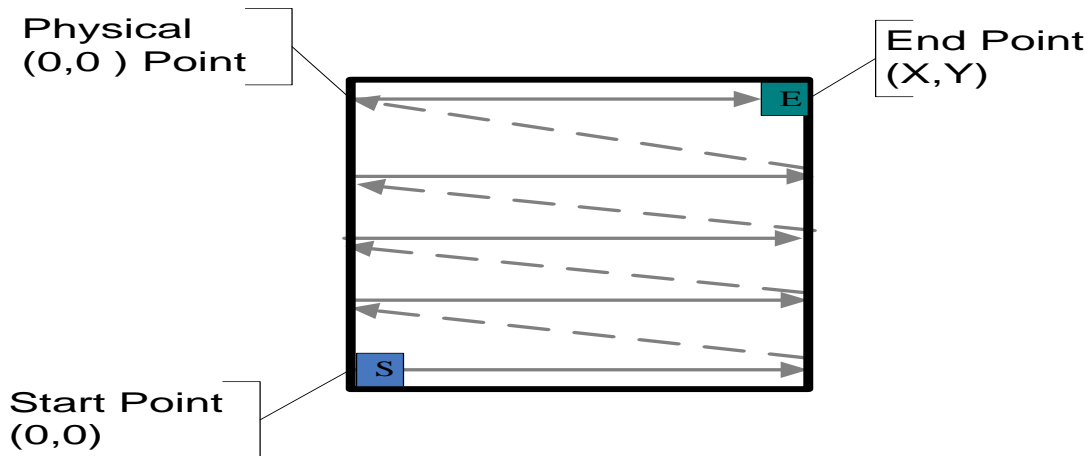

“Display Command Set (DCS) Write, No Parameter” is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0101b), from the MCU to GC9B71. These commands are defined on a table below.

Command
NOP (00h)
Software Reset (01h)
Sleep IN (10h)
Sleep Out (11h)
Partial Mode ON (12h)
Normal Display Mode ON (13h)
Display OFF (28h)
Display ON (29h)
Tearing Effect Line OFF (34h)
Idle Mode OFF (38h)
Idle Mode ON (39h)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 00 0101b
- Packet Data (PD)
 - ◆ Data 0: “Sleep In (10h)”, Display Command Set (DCS)
 - ◆ Data 1: Always 00hex
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

3.5.1.3. Display Command Set Write, 1 Parameter (DCSW1-S)

“Display Command Set (DCS) Write, 1 Parameter” (DCSW1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0101b), from the MCU to GC9B71. These commands are defined on a table below.

Command
Memory Write (2Ch), Note
Tearing Effect Line ON (35h)
Memory Access Control (36h)
Interface Pixel Format (3Ah)
Partial Mode ON (12h)
Memory Write Continue (3Ch), Note
Write Display Brightness (51h)
Write CTRL Display (53h)
Tearing Effect Line OFF (34h)
Write Content Adaptive Brightness control (55h)
Write CABC Minimum Brightness (5Eh)

Note: One Subpixel has been written

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 01 0101b
- Packet Data (PD)
 - ◆ Data 0: “Interface Pixel Format (3Ah)”, Display Command Set (DCS)
 - ◆ Data 1: 55hex, Parameter of the DCS.
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

3.5.1.4. Display Command Set Write Long (DCSW-L)

“Display Command Set (DCS) Write Long” (DCSW-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 11 1001b), from the MCU to GC9B71. Command (No Parameters) and Write (1 or more parameters) are defined on a table below.

Command
NOP (00h), Note 1
Software Reset (01h), Note 1
Sleep IN (10h) , Note 1
Sleep Out (11h) , Note 1
Partial Mode ON (12h) , Note 1
Normal Display Mode ON (13h) , Note 1
Display OFF (28h) , Note 1
Display ON (29h) , Note 1
Column Address Set (2Ah)
Page Address Set (2Bh)
Memory Write (2Ch), Note 2
Partial Area (30h)
Tearing Effect Line OFF (34h), Note 1
Tearing Effect Line ON (35h), Note 2
Memory Access Control (36h), Note 2
Idle Mode OFF (38h) , Note 1
Idle Mode ON (39h) , Note 1
Interface Pixel Format (3Ah)
Memory Write Continue (3Ch), Note 2
Write Display Brightness (51h), Note 2
Write CTRL Display (53h) , Note 2
Write Content Adaptive Brightness control (55h) , Note 2
Write CABAC Minimum Brightness (5Eh)

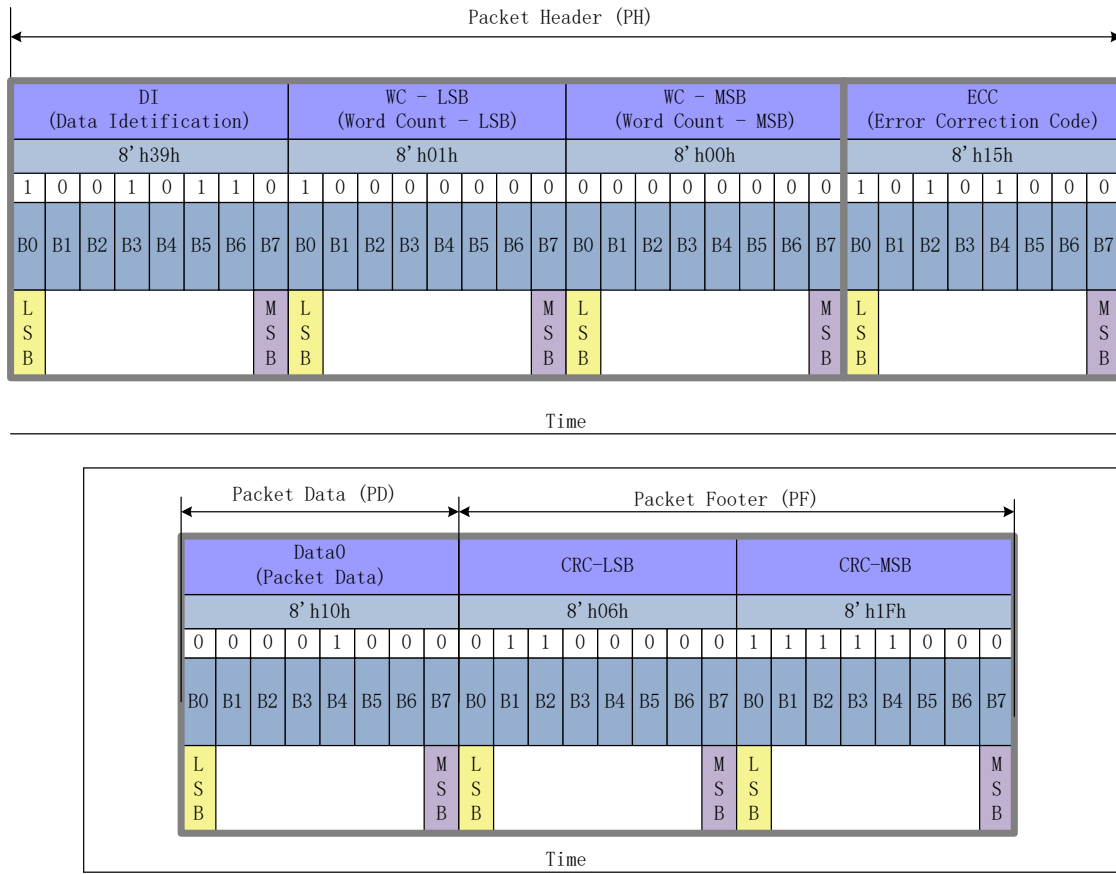

Notes: (1) Also Short Packet (SPa) can be used; See chapter “4.3.3.2.1.2 Display Command Set (DCS) Write, No Parameter”

(2) Also Short Packet (SPa) can be used; See chapter “4.3.3.2.1.3 Display Command Set (DCS) Write, 1 Parameter”

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 11 1001b
- Word Count (WC)
 - ◆ Word Count (WC): 0001h
- Error Correction Code (ECC)
- Packet Data (PD): Data 0: “Sleep In (10h)”, Display Command Set (DCS)
- Packet Footer (PF)

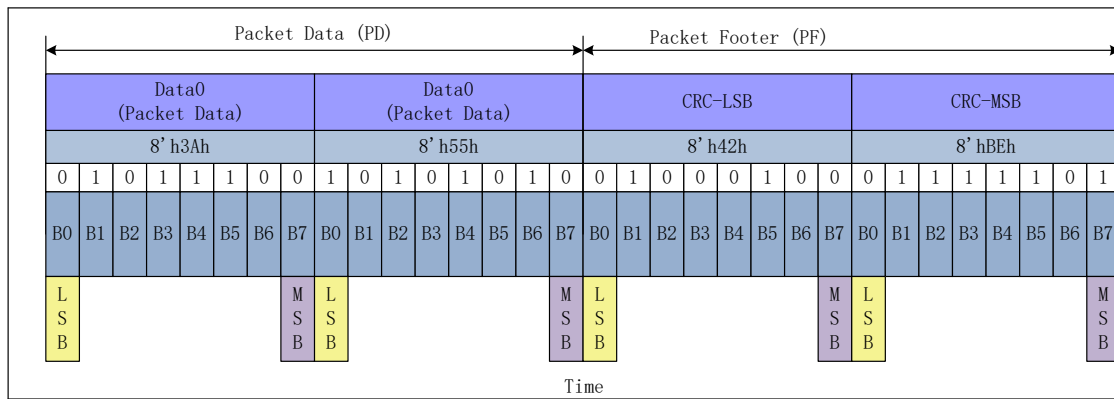

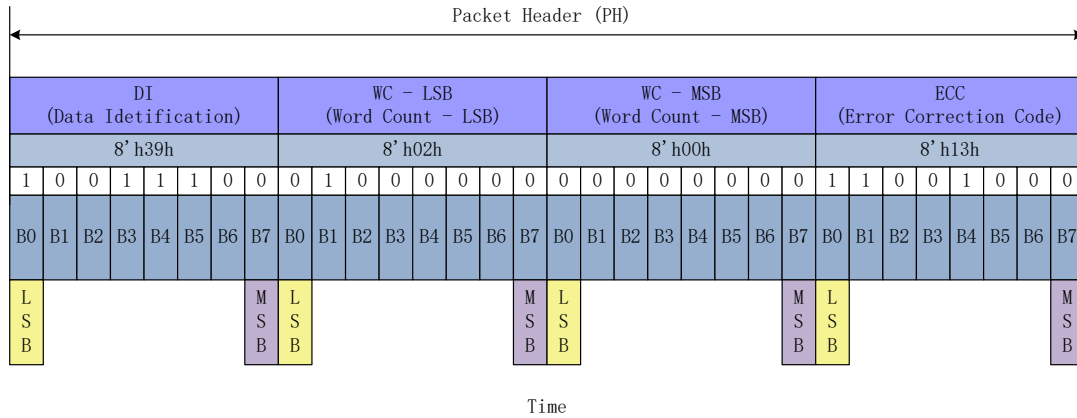

This is defined on the Long Packet (LPa) as follows.

Long Packet (LPa), when a command (1 Parameter) was sent, is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 11 1001b
- Word Count (WC)
 - ◆ Word Count (WC): 0002h
- Error Correction Code (ECC)
- Packet Data (PD):
 - ◆ Data 0: "Interface Pixel Format (3Ah)", Display Command Set (DCS)
 - ◆ Data 1: 55hex, Parameter of the DCS
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

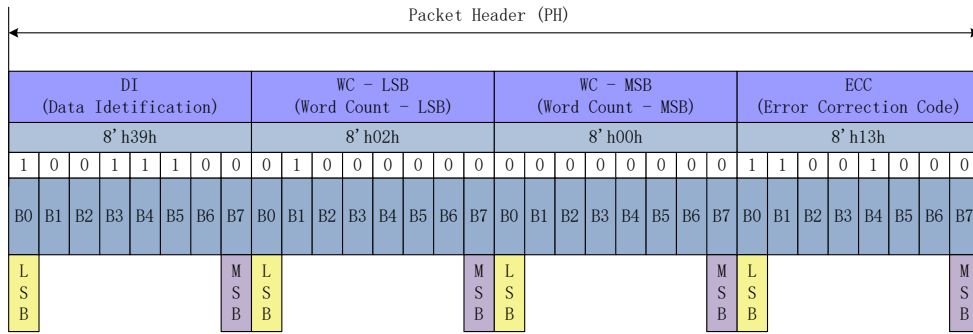

Long Packet (LPa), when a command (4 Parameter) was sent, is defined e.g.

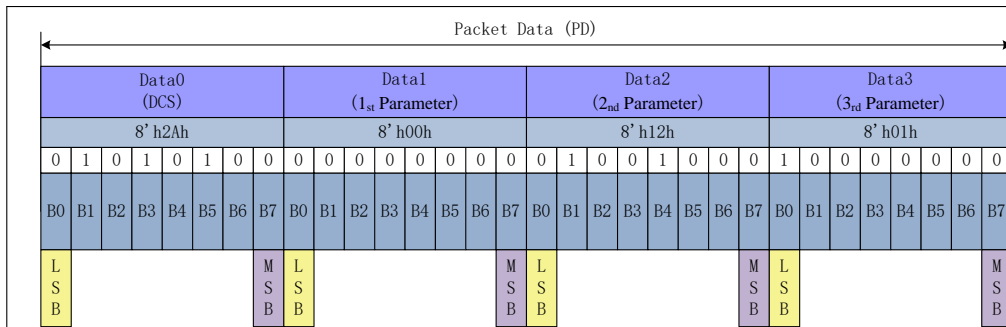

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 11 1001b
- Word Count (WC)
 - ◆ Word Count (WC): 0005h
- Error Correction Code (ECC)
- Packet Data (PD):
 - ◆ Data 0: "Column Address Set (2Ah)", Display Command Set (DCS)
 - ◆ Data 1: 00hex, 1st Parameter of the DCS, Start Column SC [15...8]
 - ◆ Data 2: 12hex, 2nd Parameter of the DCS, Start Column SC [7...0]
 - ◆ Data 3: 01hex, 3rd Parameter of the DCS, End Column SC [15...8]
 - ◆ Data 4: 01hex, 4th Parameter of the DCS, End Column SC [7...0]
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

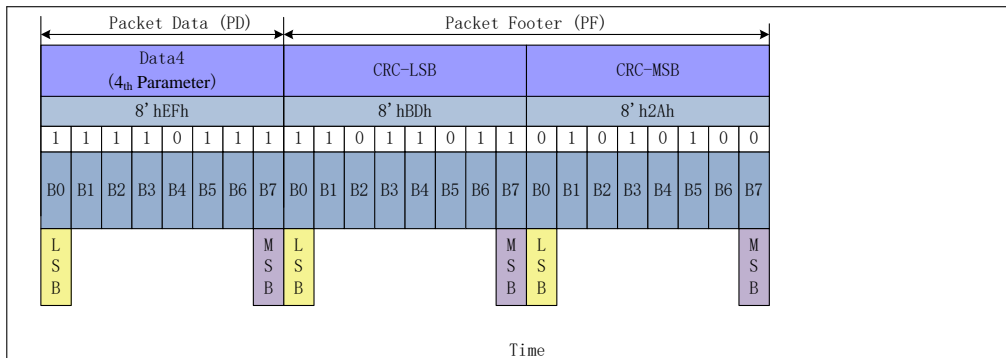

GC9B71 Datasheet

Time

Time

Time

3.5.1.5. Display Command Set Read, No Parameter (DCSRN-S)

Display Command Set (DCS) Read, No Parameter” (DCSRN-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0110b), from the MCU to GC9B71. These commands are defined on a table below. The 1st parameter (Dummy Data) is not returned as it is done in MCU parallel interface. The first returned parameter is the 2nd parameter in DSI case.

Command
Read Display Power Mode (0Ah)
Read Display MADCTL (0Bh)
Read Display Pixel Format (0Ch)
Read Display Image Mode (0Dh)
Read Display Signal Mode (0Eh)
Read Display Self-Diagnostic Result (0Fh)
Memory Read (2Eh)
Memory Read Continue (3Eh)
Read Display Brightness Value (52h)
Read CTRL Value Display (54h)
Read ID1 (DAh)
Read ID2 (DBh)
Read ID3 (DCh)

The MCU has to define to GC9B71, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size” (SMRPS-S), which Data Type (DT) is 11 0111b and which is using Short Packet (SPa) before the MCU can send “Display Command Set (DCS) Read, No Parameter” to GC9B71. This same sequence is illustrated for reference purposes below.

Step 1:

- The MCU sends “Set Maximum Return Packet Size” (Short Packet (SPa)) (SMRPS-S) to GC9B71 when it wants to return one byte from GC9B71
- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 11 0111b
- Maximum Return Packet Size (MRPS)
 - ◆ Data 0: 01hex
 - ◆ Data 1: 00hex
- Error Correction Code (ECC)

3.5.1.6. Null Packet, No Data (NP-L)

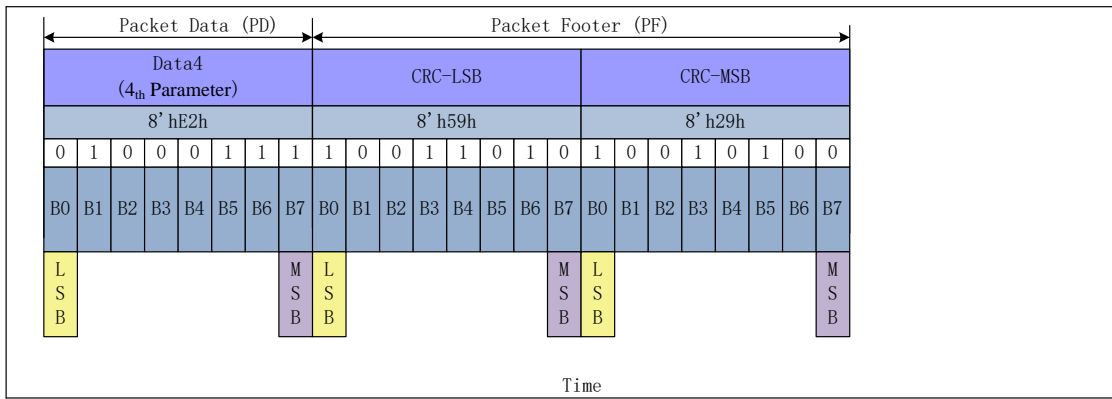

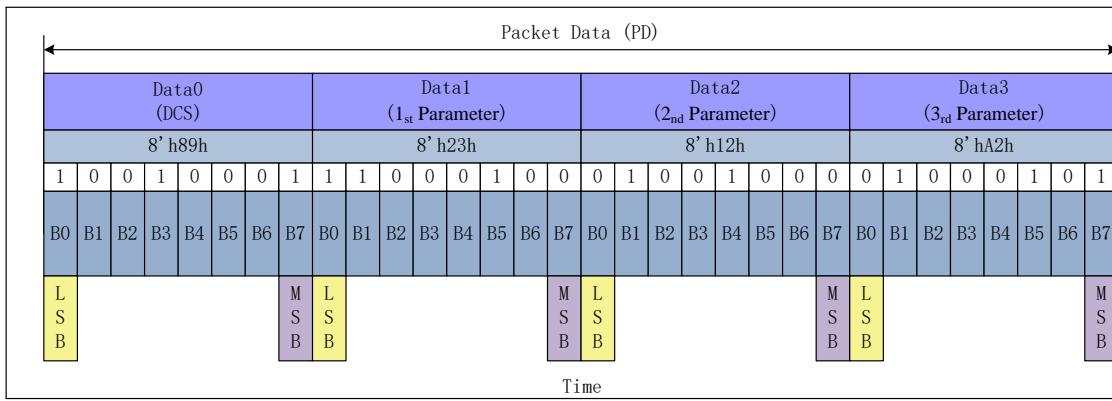

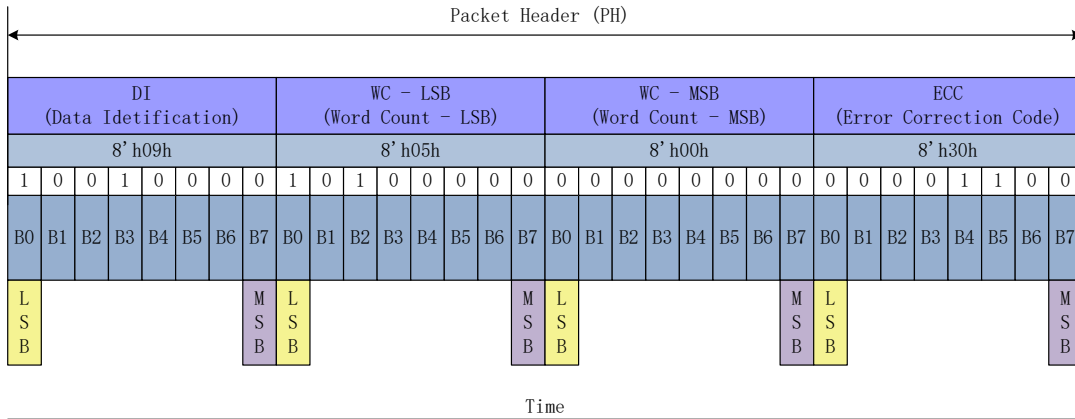

“Null Packet, No Data” (NP-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 00 1001b), from the MCU to GC9B71. The purpose of this command is keeping data lanes in the high speed mode (HSDT), if it is needed. GC9B71 is ignored Packet Data (PD) what the MCU is sending.

Long Packet (LPa), when 5 random data bytes of the Packet Data (PD) were sent, is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI [7...6]): 00b
 - ◆ Data Type (DT, DI [5...0]): 00 1001b
- Word Count (WC)
 - ◆ Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
 - ◆ Data 0: 89hex (Random data)
 - ◆ Data 1: 23hex (Random data)
 - ◆ Data 2: 12hex (Random data)
 - ◆ Data 3: A2hex (Random data)
 - ◆ Data 4: E2hex (Random data)
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

GC9B71 Datasheet

3.5.1.7. End of Transmission Packet (EoTP)

“End of Transmission Packet” (EoTP) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 1000b), from the MCU to GC9B71. The purposes of this command is terminated the high Speed Data Transmission (HSDT) mode properly when there is added this extra packet after the last payload packet before “End of Transmission” (EoT), which is an interface level functionality.

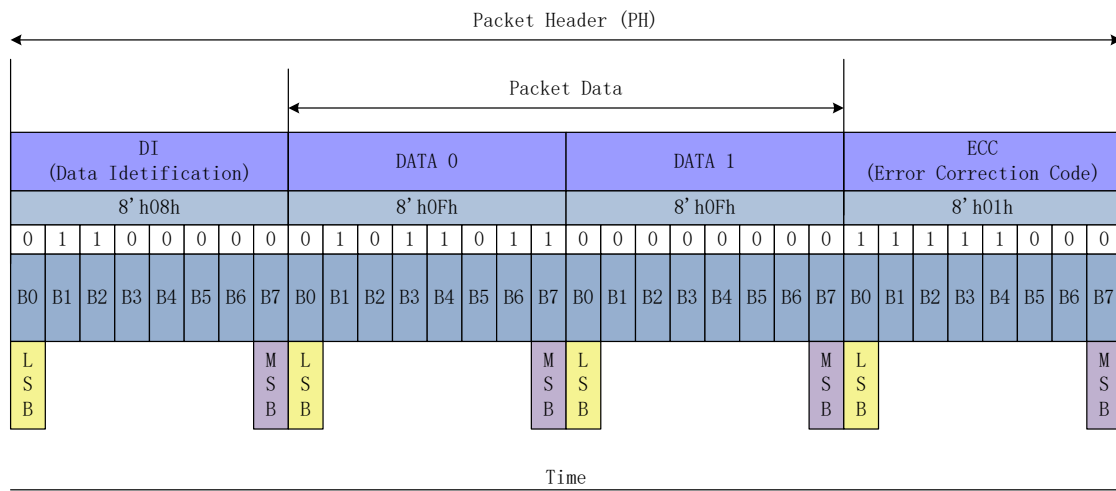

“End of Transmission Packet” (EoTP) should also be supported in the Low Power Data Transmission (LPDT) mode on GC9B71e even if this functionality has not been designed for this purposes.

The MCU can decide if it wants to use these “End of Transmission Packet” (EoTP) or not but GC9B71 has to be supporting both modes: With or Without “End of Transmission Packet” (EoTP).

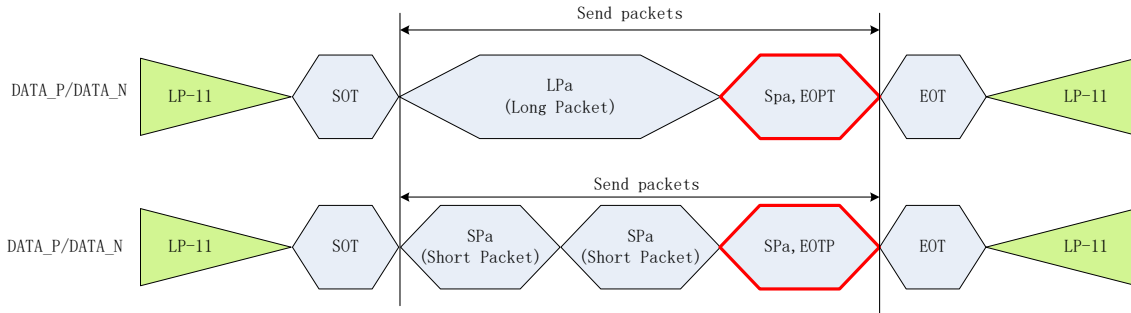

Short Packet (SPa) is using a fixed format as follows

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI [7...6]): 00b
 - ◆ Data Type (DT, DI [5...0]): 00 1000b
- Packet Data (PD)
 - ◆ Data 0: 0Fhex
 - ◆ Data 1: 0Fhex
- Error Correction Code (ECC)
 - ◆ ECC: 01hex

This is defined on the Short Packet (SPa) as follows.

Some use cases of the “End of Transmission Packet” (EoTP) are illustrated only for reference purposes below.

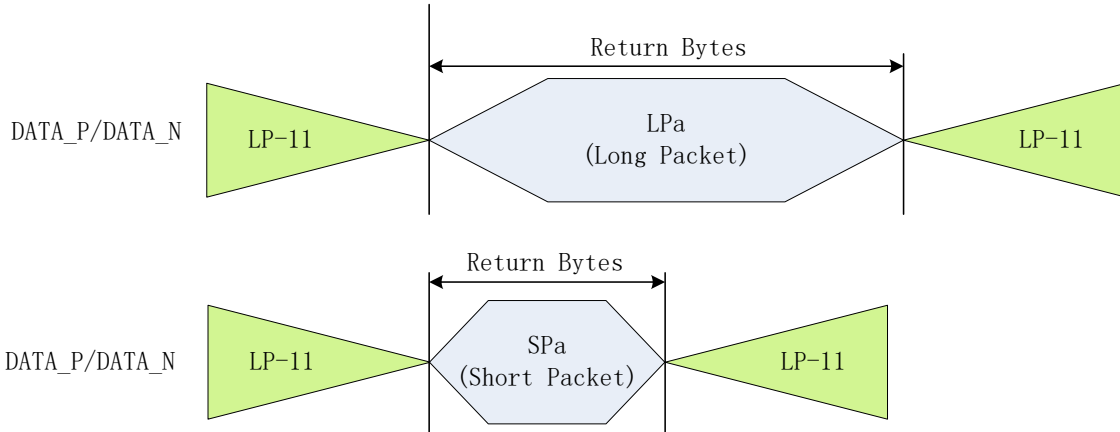

3.5.2. Packet from GC9B71 to MCU

3.5.2.1. Used Packet Types

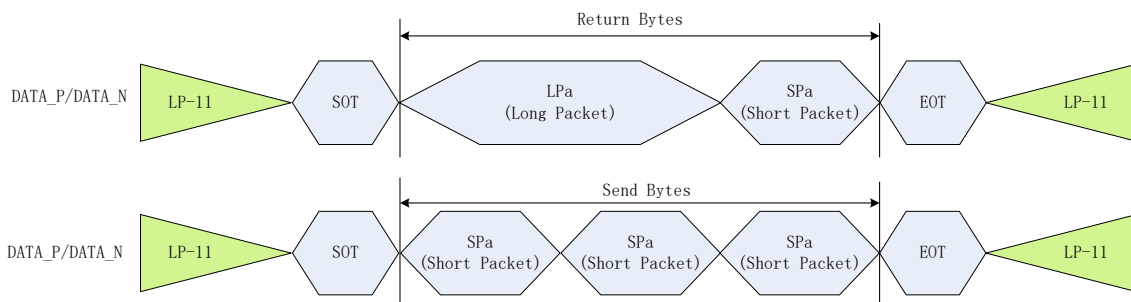

GC9B71 is always using Short Packet (SPa) or Long Packet (LPa), when it is returning information to the MCU after the MCU has requested information from GC9B71. This information can be a response of the Display Command Set (DCS) or an Acknowledge with Error Report (AwER). The used packet type is defined on Data Type (DT).

It is not possible that GC9B71 is sending return bytes in several packets even if the maximum size of the Packet Data (PD) could be sent in one packet.

The return bytes on a single packet are illustrated for reference purposes below.

The return bytes on several packets are illustrated for reference purposes below.

3.5.2.2. Acknowledge with Error Report

“Acknowledge with Error Report” (AwER) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0010b), from GC9B71 to the MCU.

The Packet Data (PD) can include bits, which are defining the current error, when a corresponding bit is set to ‘1’, as they are defined on the following table.

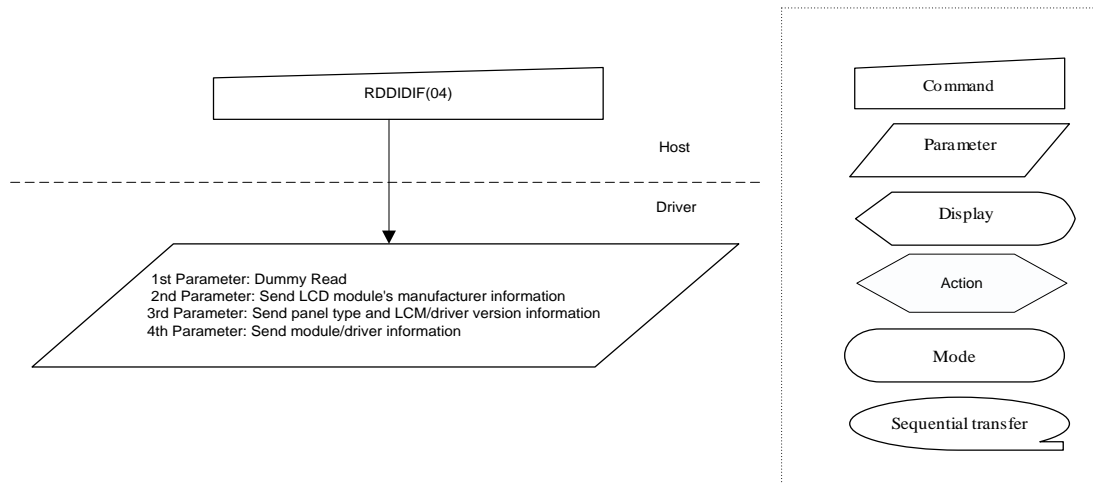

Bit	The Description of Acknowledge Error Report (AwER)	
	Short Packet	Long Packet
0	SoT Error	SoT Error
1	SoT Sync Error	SoT Sync Error
2	EoT Sync Error	EoT Sync Error
3	Escape Mode Entry Command Error	Escape Mode Entry Command Error
4	Low-Power Transmit Error	Low-Power Transmit Error
5	Any Protocol Timer-Out	Any Protocol Timer-Out
6	False Control Error	False Control Error
7	Contention is Detected on the Display Module	Contention is Detected on the Display Module
8	ECC Error, Single-Bit (Detected and Corrected)	ECC Error, Single-Bit (Detected and Corrected)
9	ECC Error, Multi-Bit (Detected, Not Corrected)	ECC Error, Multi-Bit (Detected, Not Corrected)
10	Reserved, Set to ‘0’ internally	Checksum Error
11	DSI Data Type (DT), Not Recognized	DSI Data Type (DT), Not Recognized
12	DSI Virtual Channel (VC) ID Invalid	DSI Virtual Channel (VC) ID Invalid
13	DSI Protocol Violation	DSI Protocol Violation
14	Reserved, Set to ‘0’ internally	Reserved, Set to ‘0’ internally
15	Reserved, Set to ‘0’ internally	Reserved, Set to ‘0’ internally

These errors are included from all packages what has been received from the MCU to GC9B71, before Bus Turnaround (BTA). GC9B71 ignores the received packet which includes error or errors.

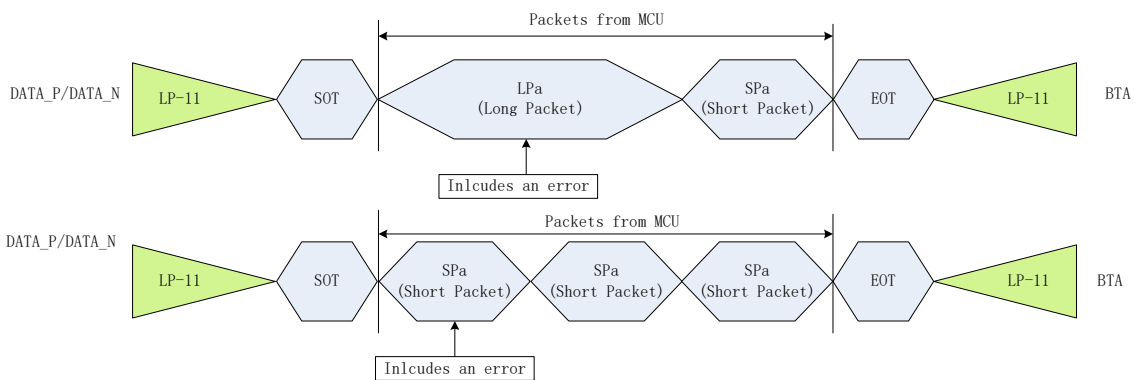

Acknowledge with Error Report (AwER) of the Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI[7...6]): 00b
 - ◆ Data Type (DT, DI[5...0]): 00 0010b
- Packet Data (PD)
 - ◆ Bit 8: ECC Error, single-bit (detected and corrected)
 - ◆ AwER: 0100h
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

It is possible that GC9B71 has received several packets, which have included errors, from the MCU before the MCU is doing Bus Turnaround (BTA). Some examples are illustrated for reference purposes below.

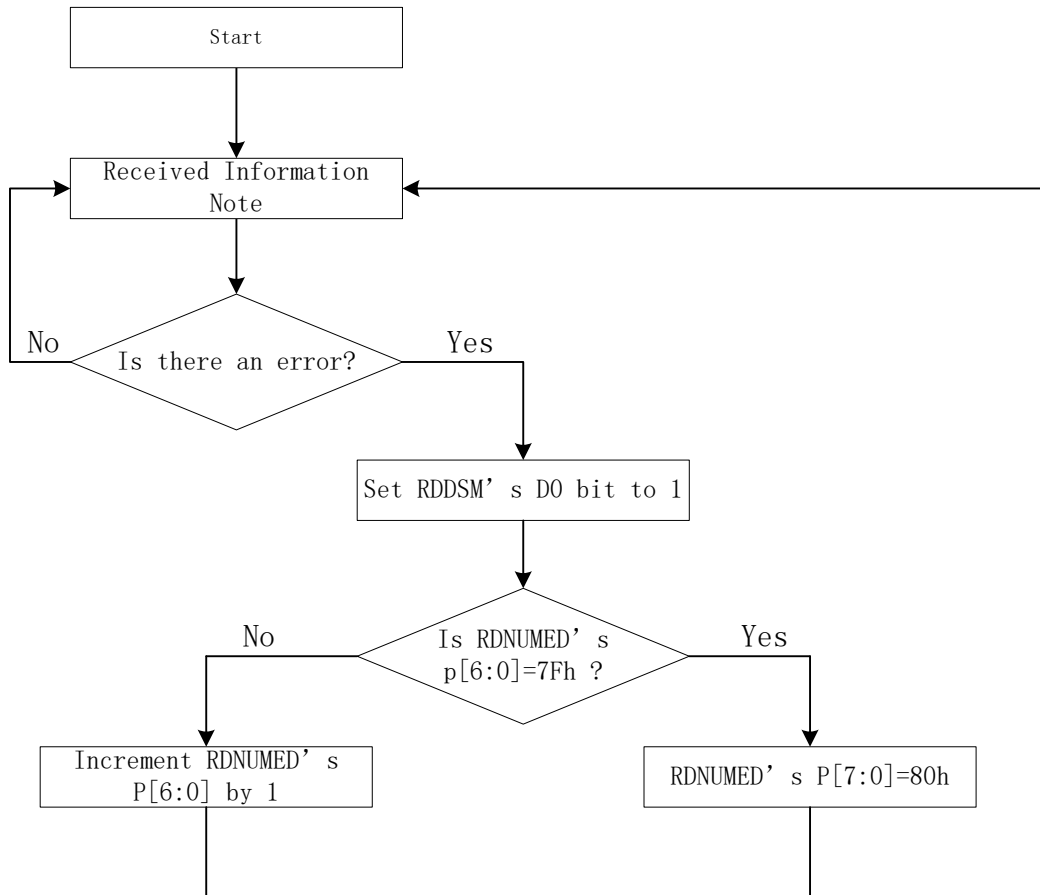

Therefore, there is needed a method to check if there has been errors on the previous packets. These errors of the previous packets can check “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands.

The bit D0 of the “Read Display Signal Mode (0Eh)” command has been set to ‘1’ if a received packet includes an error.

The numbers of the packets, which are including an error, are calculated on the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command. This command also sets the RDNUMED register to 00h as well as set the bit D0 of the “Read Display Signal Mode (0Eh)” command to ‘0’ after the MCU has read the RDNUMED register from GC9B71.

The functionality of the RDNUMED register is illustrated for reference purposes below.

Note: This information can Interface or Packet Level Communication but it is always from the MCU to GC9B71 in this case.

3.5.2.3.DCS Read Long Response (DCSRR-L)

“DCS Read Long Response” (DCSRR-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 01 1100b), from GC9B71 to the MCU.

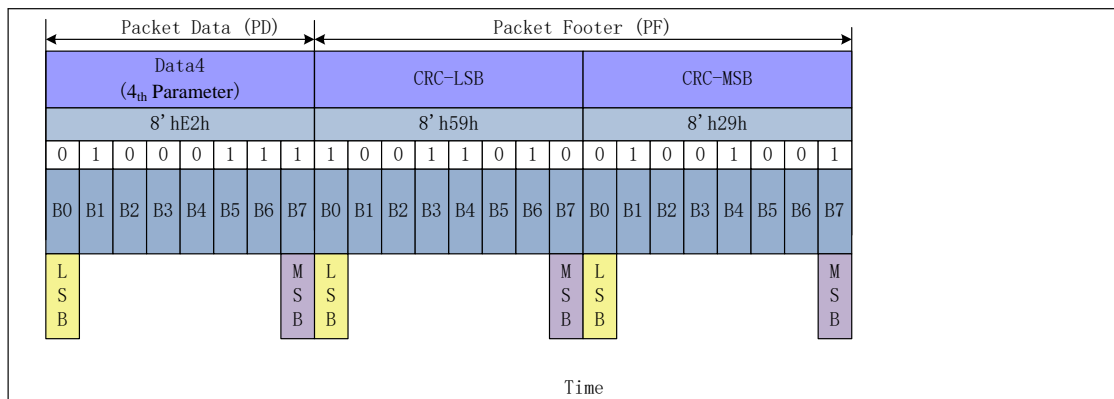

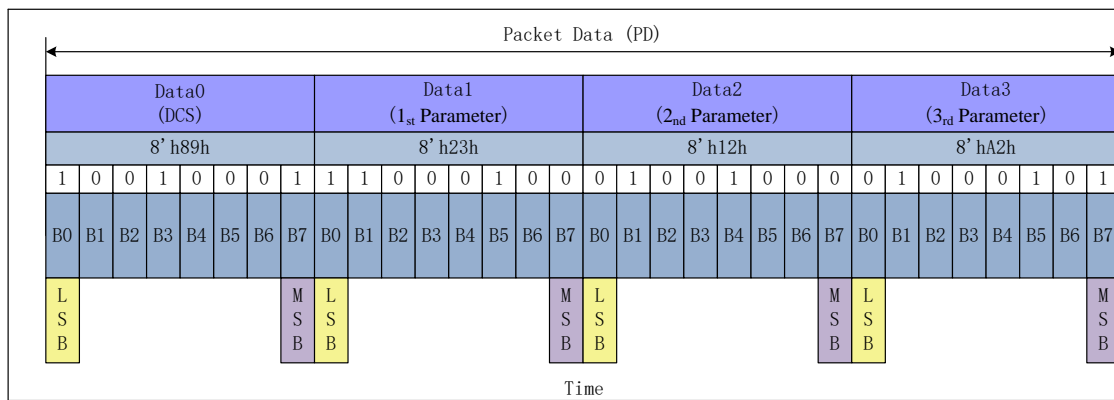

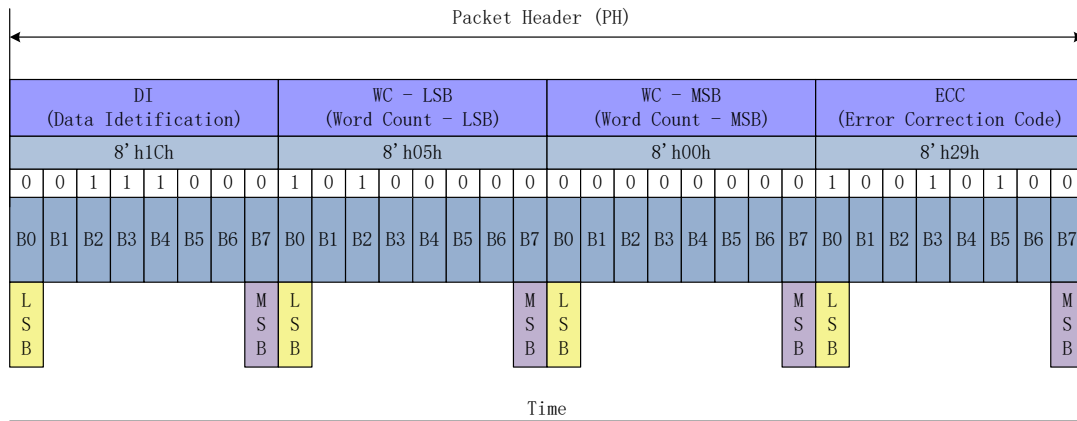

“DCS Read Long Response” (DCSRR-L) is used when GC9B71 wants to response a DCS Read command, which the MCU has sent to GC9B71.

Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), is defined e.g.

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
 - ◆ Data Type (DT, DI [5...0]): 01 1100b
- Word Count (WC)
 - ◆ Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
 - ◆ Data 0: 89hex
 - ◆ Data 1: 23hex
 - ◆ Data 2: 12hex
 - ◆ Data 3: A2hex
 - ◆ Data 4: E2hex
- Packet Footer (PF)

This is defined on the Long Packet (LP) as follows.

GC9B71 Datasheet

3.5.2.5. DCS Read Short Response, 2 Bytes Returned

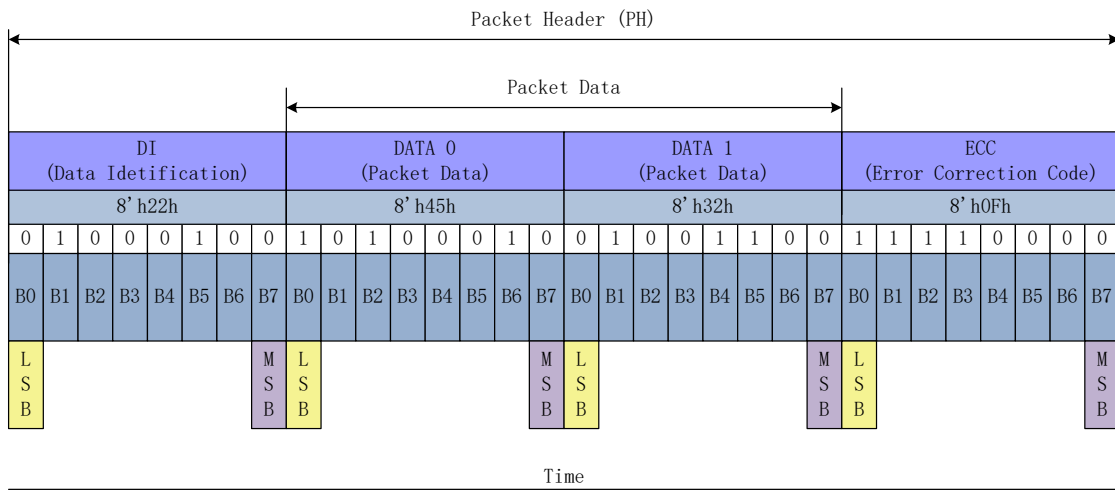

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0010b), from GC9B71 to the MCU.

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is used when GC9B71 wants to response a DCS Read command, which the MCU has sent to GC9B71.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - ◆ Virtual Channel (VC, DI [7...6]): 00b
 - ◆ Data Type (DT, DI [5...0]): 10 0010b
- Packet Data (PD)
 - ◆ Data 0: 45hex
 - ◆ Data 1: 32hex
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

3.6. Communication Sequences

The communication sequences can be done on interface or packet levels between the MCU and GC9B71. This communication sequence description is for DSI data lanes (DSI-D0+/-) and it has been assumed that the needed low level communication is done on DSI clock lanes (DSI-CLK+/-) automatically.

Functions of the interface level communication are described on the following table.

Interface Mode	Abbreviation	Interface Action Description
Low Power	LP-11	Stop State
	LPDT	Low power data transmission
	ULPS	Ultra-Low Power State
	RAR	Remote Application Reset
	TEE	Tearing Effect Event
	ACK	Acknowledge (No Error)
	BTA	Bus Turnaround
High Speed	HSDT	High speed Data Transmission

Functions of the packet level communication are described on the following table.

Interface	Mode Abbreviation	Packet Size	Interface Action Description
MCU	DCSW1-S	Short Packet	DCS Write, 1 Parameter
	DCSWN-S	Short Packet	DCS Write, No Parameter
	DCSW-L	Long Packet	DCS Write Long
	DCSRN-S	Short Packet	DCS Read, No Parameter
	SMRPS-S	Short Packet	Set Maximum Return Packet Size
	NP-L	Long Packet	Null Packet, No Data
	EoTP	Short Packet	End of Transmission Packet
GC9B71	AwER	Short Packet	Acknowledge with Error Packet
	DCSRR-L	Long Packet	DCS Read Long Response
	DCSRR1-S	Short Packet	DCS Read Short Response
	DCSRR2-S	Short Packet	DCS Read Short Response

3.6.1. DCS Write, 1 Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” is defined on chapter “4.3.3.2.1.3 Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” and example sequences, how this packet is used, is described on following tables.

DCS Write, 1 Parameter Sequence – Example 1						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	LPDT	→	-	-	
3	-	LP-11	→	-	-	End

DCS Write, 1 Parameter Sequence – Example 2						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	HSDT	→	-	-	
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	End

DCS Write, 1 Parameter Sequence – Example 3						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	HSDT	→	-	-	
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	
5	-	BTA	↔	BTA	-	Interface Control Change from MCU to GC9B71
6	-	-	←	LP-11	-	If No Error → Go to Line 8 If Error Occurs → Go to Line 13
7						
8	-	-	←	ACK		No Error

GC9B71 Datasheet

9	-	-	←	LP-11	-	
10	-	BTA	↔	BTA	-	Interface Control Change from the GC9B71 to MCU
11	-	LP-11	→	-	-	End

14	-	-	←	LP-11	-	
15	-	BTA	↔	BTA	-	
16	-	LP-11	→	-	-	End

3.6.2. DCS Write, No Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Write, No Parameter (DCSWN-S)” is defined on chapter “4.3.3.2.1.2 Display Command Set (DCS) Write, No Parameter (DCSWN-S)” and example sequences, how this packet is used, is described on following tables.

DCS Write, 0 Parameter Sequence – Example 1						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	LPDT	→	-	-	
3	-	LP-11	→	-	-	End

DCS Write, 0 Parameter Sequence – Example 2						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	HSDT	→	-	-	
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	End

DCS Write, 0 Parameter Sequence – Example 3						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-S	HSDT	→	-	-	
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	
5	-	BTA	↔	BTA	-	Interface Control Change from MCU to GC9B71
6	-	-	←	LP-11	-	If No Error → Go to Line 8 If Error Occurs → Go to Line 13

3.6.3. DCS Write, Long Sequence

A Long Packet (LPa) of “Display Command Set (DCS) Write Long (DCSW-L)” is defined on chapter “4.3.3.2.1.4 Display Command Set (DCS) Write Long (DCSW-L)” and example sequences, how this packet is used, is described on following tables.

DCS Write, Long Parameter Sequence – Example 1						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-I	LPDT	→	-	-	
3	-	LP-11	→	-	-	End

DCS Write, Long Parameter Sequence – Example 2						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	DCSW1-L	HSDT	→	-	-	
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	End

DCS Write, Long Parameter Sequence – Example 3

6	EoTP	HSDT	→			End of Transmission Packet
7	-	LP-11	→			End

Note: This is an example where is wanted to send image data in 4 packets.

3.6.4. DCS Read, No Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Read, No Parameter (DCSRN-S)” is defined on chapter “4.3.3.2.1.5 Display Command Set (DCS) Read, No Parameter (DCSRN-S)” and example sequences, how this packet is used, is described on following tables.

DCS Read, No Parameter Sequence – Example 1						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start

3.6.5. Null Packet, No Data Sequence

A Long Packet (LPa) of “Null Packet, No Data (NP-L)” is defined on chapter “4.3.3.2.1.6 Null Packet, No Data (NP-L)” and an example sequence, how this packet is used, is described on the following table.

Null Packet, No Data Sequence – Example						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	NP-L	HSDT	→	-	-	Only High Speed Data Transmission is used
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	End

3.6.6. End of Transmission Packet

A Short Packet (SPa) of “End of Transmission Packet (EoTP)” is defined on chapter “4.3.3.2.1.7 End of Transmission Packet (EoTP)” and an example sequence, how this packet is used, is described on the following table.

End of Transmission Packet – Example						
line	MCU		Information Direction	GC9B71		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	→	-	-	Start
2	NP-L	HSDT	→	-	-	Only High Speed Data Transmission is used
3	EoTP	HSDT	→	-	-	End of Transmission Packet
4	-	LP-11	→	-	-	End

4. Function Description

4.1. Display data GRAM mapping

The display data RAM stores display dots and consists of 360x360x18 bits. There is no restriction on access to the RAM even when the display data on the same address is loaded to DAC. There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

Every pixel (18-bit) data in GRAM is located by a (Page, Column) address (Y, X). By specifying the arbitrary window address **SC**, **EC** bits and **SP**, **EP** bits, it is possible to access the GRAM by setting RAMWR or RAMRD commands from start positions of the window address.

GRAM address for display panel position as shown in the following table

Table31.

(00,00)h	(00,01)h	(00, 165)h	(00, 166)h	(00,167)h
(01,00)h	(01,01)h	(01, 165)h	(01, 166)h	(01, 167)h
(02,00)h	(02,01)h	(02, 165)h	(02, 166)h	(02, 167)h
(03,00)h	(03,01)h	(03, 165)h	(03, 166)h	(03, 167)h
· ·	· ·	· ·	· ·	· ·	· ·
·	·	·	·	·	·
(165,00)h	(165,01)h	(165, 165)h	(165, 166)h	(165, 167)h
(166,00)h	(166,01)h	(166, 165)h	(165, 166)h	(166, 167)h
(167,00)h	(167,01)h	(167, 165)h	(165, 166)h	(167, 167)h

4.2. MCU to memory write/read direction

The Counter which dictates where in the physical memory the data is to be written is controlled by “Memory Data Access Control” Command, Bits D5, D6, and D7 as described below.

D5	D6	D7	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (359-Physical Page Pointer)
0	1	0	Direct to (359-Physical Column Pointer)	Direct to Physical Page Pointer
0	1	1	Direct to (359-Physical Column Pointer)	Direct to (359-Physical Page Pointer)
1	0	0	Direct to Physical Page Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (359-Physical Page Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Page Pointer	Direct to (359-Physical Column Pointer)
1	1	1	Direct to (359-Physical Page Pointer)	Direct to (359-Physical Column Pointer)
Condition			Column Counter	Page counter
When RAMWR/RAMRD command is accepted			Return to "Start column"	Return to "Start Page"
Complete Pixel Read/Write action			Increment by 1	No change
The Column values is large than "End Column"			Return to "Start column"	Increment by 1
The Page counter is large than "End Page"			Return to "Start column"	Return to "Start Page"

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0

One pixel unit represents 1 column and 1 page counter value on the Frame Memory.

Display Data Direction	MADCTR Parameter			Image in the Memory (MCU)	Image in the Driver (Frame Memory)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
X-Y Exchange X-Mirror	1	1	0		
X-Y Exchange X-Mirror Y-Mirror	1	1	1		

4.3. GRAM to display address mapping

By setting the **SS**, the relation between the source output channel and the GRAM address can be changed as reverse display. By setting the **GS**, the relation between the gate output channel and the GRAM address can be changed as reverse display. By setting the **BGR**, the relation between the source output channel and the <R>, <G>, dot allocation can be reversed for different LCD color filter arrangement.

The following Tables show relations among the GRAM data allocation, the source output channel, and the R, G, B dot allocation.

GRAM X address and display panel position:

GC9B71 supports three kinds of display mode: one is Normal Display Mode, the other is Partial Display Mode, and Scrolling Display Mode.

4.3.1. Normal display on or partial mode on, vertical scroll off

In this mode, content of the frame memory within an area where column pointer is 0000h to 0167h and page pointer is 0000h to 0167h is displayed.

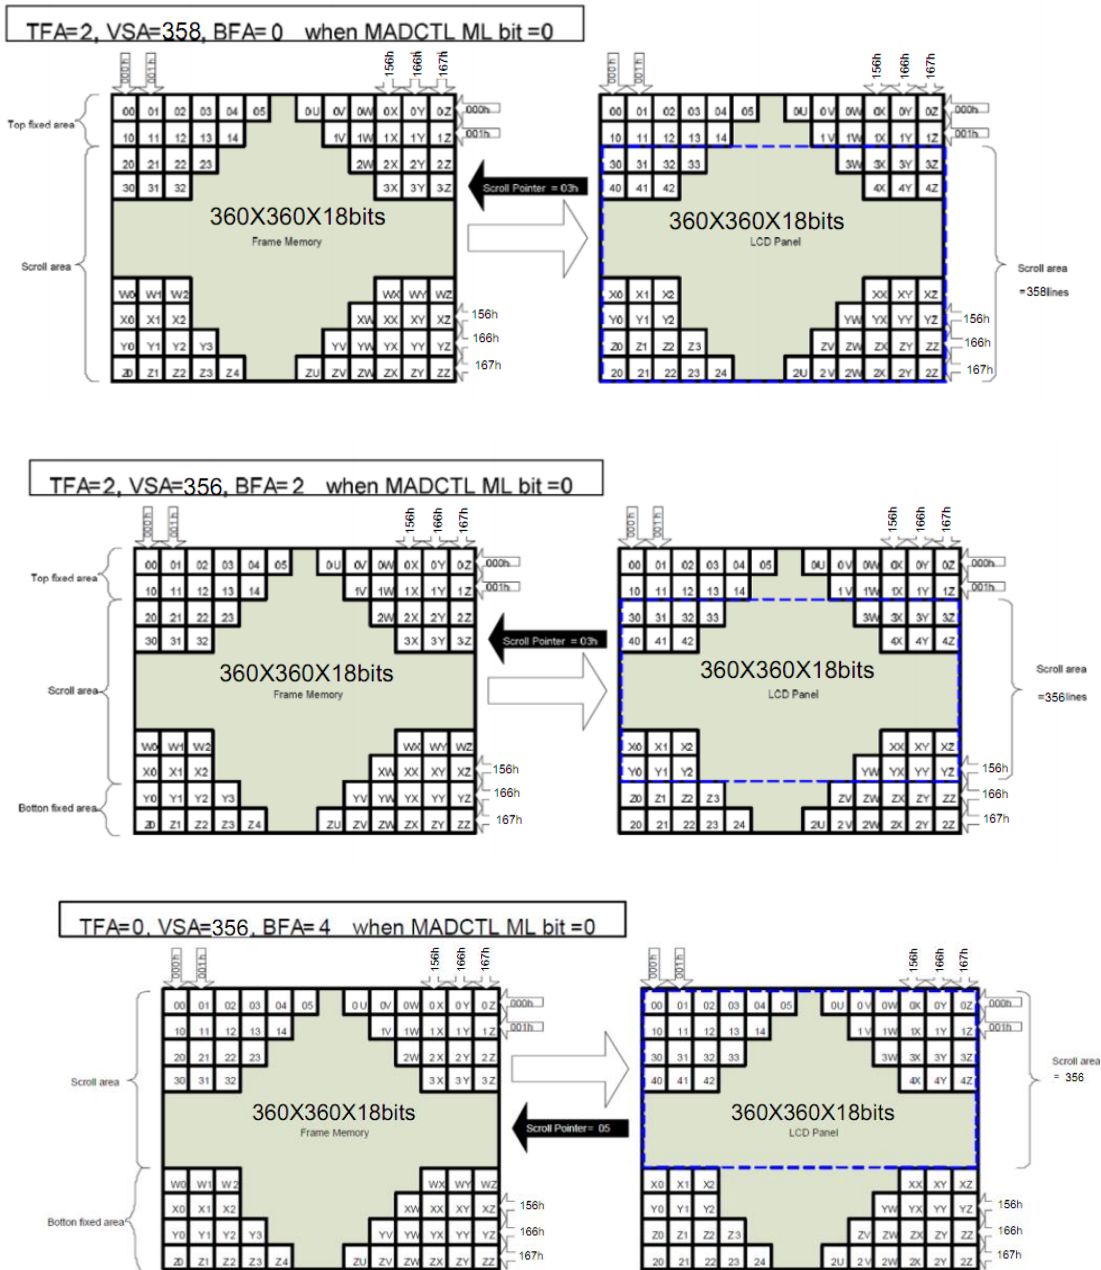

To display a dot on leftmost top corner, store the dot data at (column pointer, page pointer) = (0,0)

Figure66.

4.3.2. Vertical scroll display mode

When setting R37h, the scrolling display mode is active, and the vertical scrolling display is specified by **TFA**, **VSA**, **BFA** bits (R33h) and **VSP** bits (R37h).

Note: When Vertical Scrolling Definition Parameters (TFA+VSA+BFA) ≠360, Scrolling Mode is undefined.

4.4. Tearing effect output line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

4.4.1. Tearing effect line modes

Mode 1, The Tearing Effect Output signal consists of V-Blanking Information only:

Figure79.

tvdh= The LCD display is not updated from the Frame Memory

tvdl = The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Mode 2, The Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 360 H-sync pulses per field.

Figure80.

thdh= The LCD display is not updated from the Frame Memory

thdl= The LCD display is updated from the Frame Memory (except Invisible Line – see above)

4.4.2.Tearing effect line timing

The Tearing Effect signal is described below.

Figure81.

Idle Mode Off (Frame Rate = 20~65 Hz)

Table38.

Symbol	Parameter	Spec.			Description
		Min.	Max.	Unit	
tvdl	Vertical Timing Low Duration	TBD	-	ms	-
tvdh	Vertical Timing High Duration	1000	-	us	-
thdl	Horizontal Timing Low Duration	TBD	-	us	-
thdh	Horizontal Timing High Duration	TBD	500	us	-

Note: Idle Mode Off (Frame Rate = 20~65 Hz) ,The signal’s rise and fall times (tf, tr) are stipulated to be equal to or less than 15ns.

Figure82.

The Tearing Effect Output Line is fed back to the MCU and should be used to avoid Tearing Effect.

4.5. Source driver

The GC9B71 contains a 540 channels of source driver (S1~S540) which is used for driving the source line of TFT LCD panel. The source driver converts the digital data from GRAM into the analog voltage for 540 channels and generates corresponding gray scale voltage output, which can realize a 262K colors display simultaneously. Since the output circuit of this source driver incorporates an operational amplifier, a positive and a negative voltage can be alternately outputted from each channel.

4.6. Gate driver

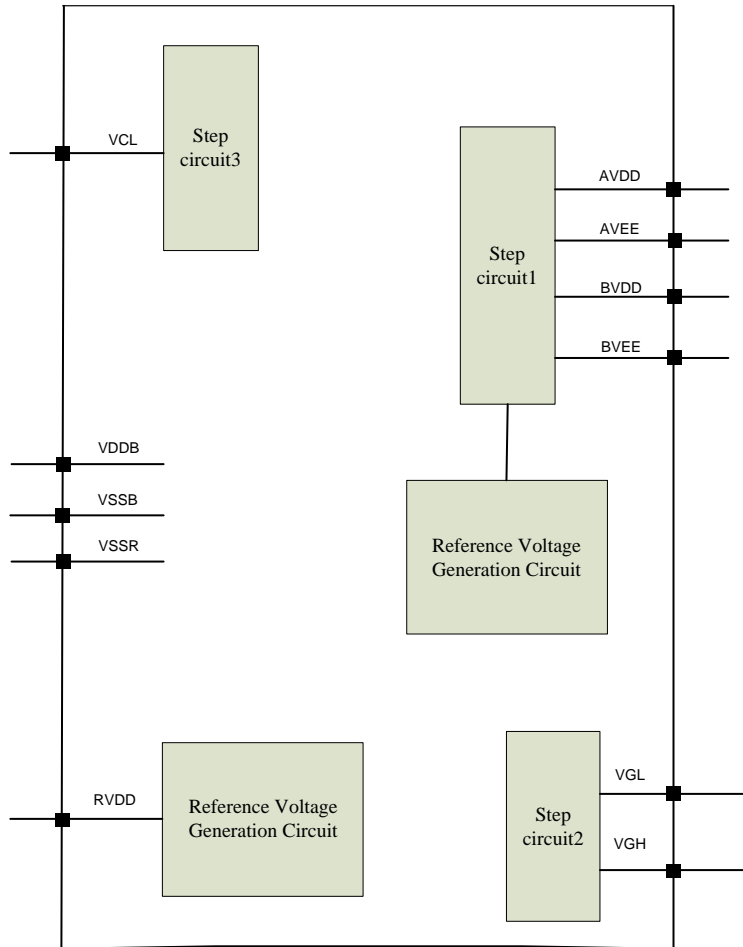

The GC9B71 contains a 32 gate channels of gate driver (G1~G32) which is used for driving the gate. The gate driver level is VGH when scan some line, VGL the other lines.

4.7. LCD power generation circuit

4.7.1. Power supply circuit

The power circuit of GC9B71 is used to generate supply voltages for LCD panel driving.

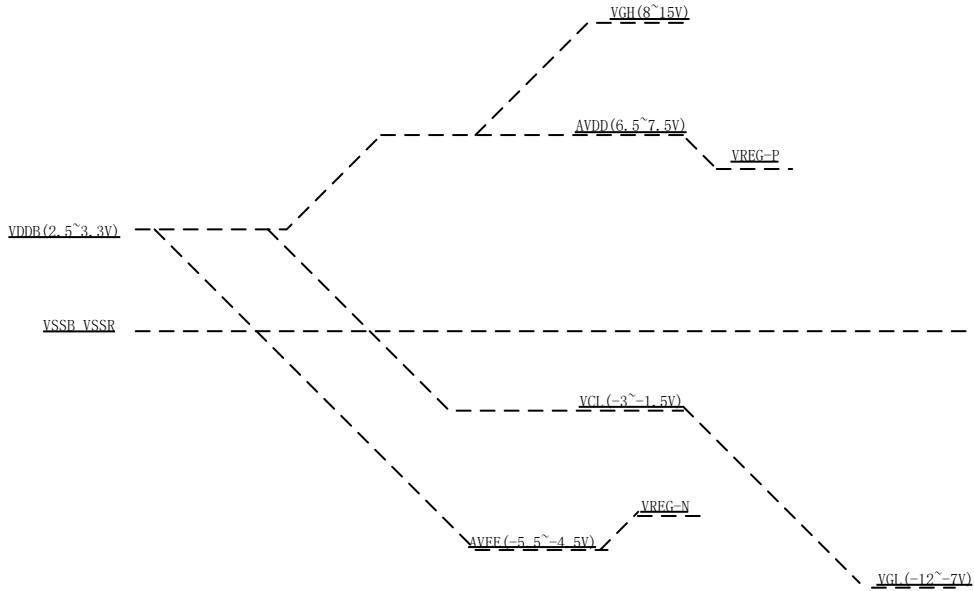

Figure83.

4.7.2.LCD power generation scheme

The boost voltage generated is shown as below.

Figure84.

LCD power generation scheme

4.8. Gamma Correction

GC9B71 incorporates the γ -correction function to display 262,144 colors for the LCD panel. The γ -correction is performed with 3 groups of registers determining eight reference grayscale levels, which are gradient adjustment, amplitude adjustment and fine-adjustment registers for positive and negative polarities, to make GC9B71 available with liquid crystal panels of various characteristics.

Figure85.

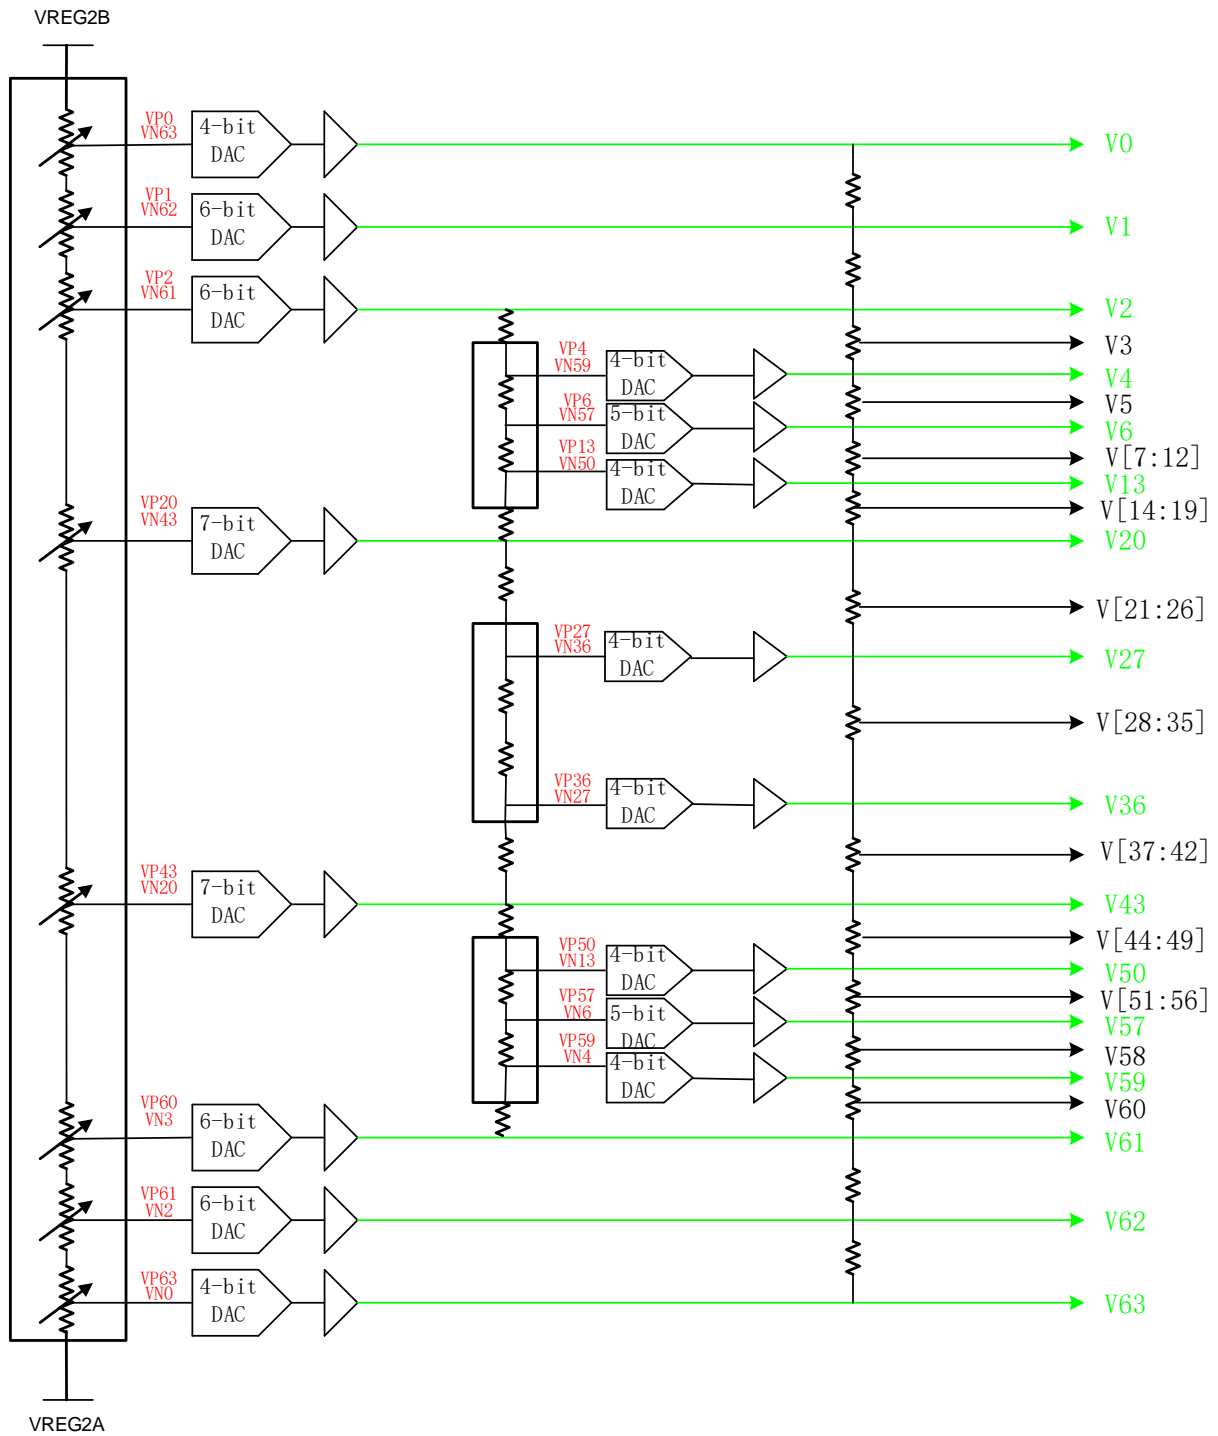

Figure86.

Grayscale Voltage Generation

Figure87.Dot inversion

Relationship between Source Output and VCOM

Figure88.

4.9. Power Level Definition

4.9.1. Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode.

In this mode, the DC : DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

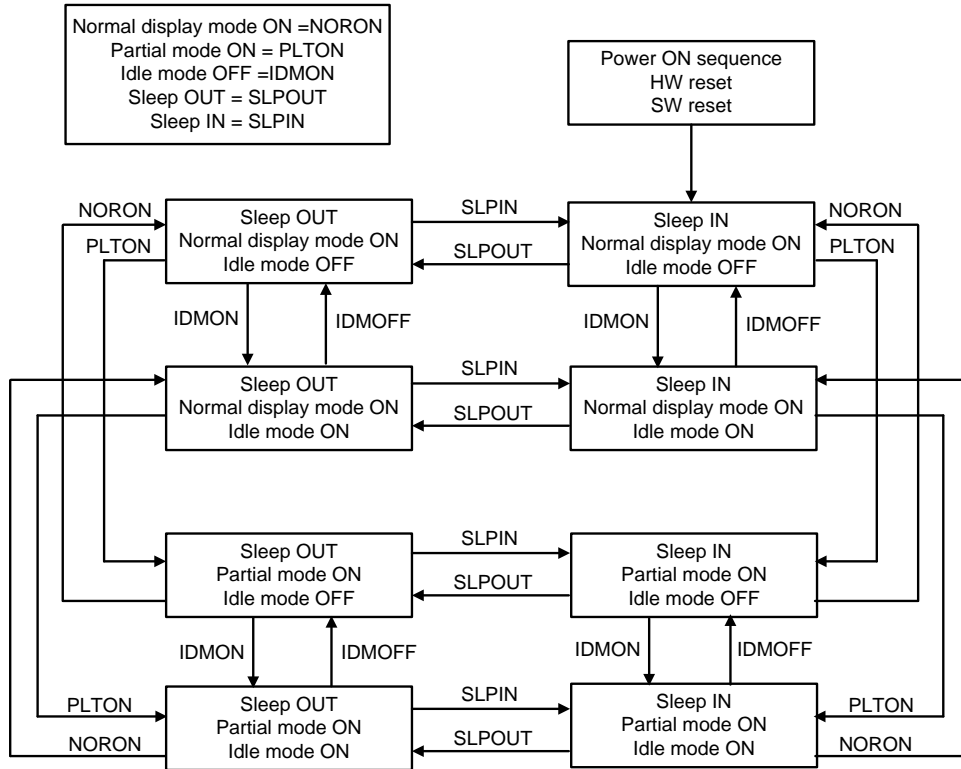

6. Power Off Mode.

In this mode, both VDDB and VDDI are removed.

Note1: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

4.9.2. Power Flow Chart

Figure89.

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by User, when there is changing from one power mode to another power mode.

4.10. Brightness control block

There is an external output signal from brightness block, LEDPWM to control the LED driver IC in order to control display brightness.

There are register bits, DBV[7:0] of R51h, for display brightness of manual brightness setting. The LEDPWM duty is calculated as $DBV[7:0]/255 \times \text{period}$ (affected by OSC frequency).

For example: LEDPWM period = 3ms, and DBV[7:0] = '200DEC'. Then LEDPWM duty = $200 / 255 = 78.1\%$. Correspond to the LEDPWM period = 3 ms, the high-level of LEDPWM (high effective) = 2.344ms, and the low-level of LEDPWM = 0.656ms.

Figure90.

4.11. Input/output pin state

4.11.1. Output pins

Table40.

Output or Bi-directional pins	After Power On	After Hardware Reset

Description	This command indicates the current status of the display as described in the table below:												
	Bit	Description	Value	Status									
	D31	Booster voltage status	0	Booster OFF									
			1	Booster ON									
	D30	Row address order	0	Top to Bottom (When MADCTL B7='0')									
			1	Bottom to Top (When MADCTL B7='1')									
	D29	Column address order	0	Left to Right (When MADCTL B6='0').									
			1	Right to Left (When MADCTL B6='1').									
	D28	Row/column exchange	0	Normal Mode (When MADCTL B5='0').									
			1	Reverse Mode (When MADCTL B5='1').									
	D27	Vertical refresh	0	LCD Refresh Top to BoUom (When MADCTL B4='0')									
			1	LCD Refresh BoUom to Top (When MADCTL B4='1').									
	D26	RGB/BGR order	0	RGB (When MADCTL B3='0')									
			1	BGR (When MADCTL B3='1')									
	D25	Horizontal refresh order	0	LCD Refresh Left to Right (When MADCTL B2='0')									
			1	LCD Refresh Right to Left (When MADCTL B2='1')									
	D24	Not used	0	-									
D23	Not used	0	-										
D22	Interface color pixel format definition	101	16-bit/pixel										
D21			18-bit/pixel										
D20													
D19	Idle mode ON/OFF	0	Idle Mode OFF										
		1	Idle Mode ON										
D18	Partial mode ON/OFF	0	Partial Mode OFF										
		1	Partial Mode ON										
D17	Sleep IN/OUT	0	Sleep IN Mode										

			1	Sleep OUT Mode										
	D16	Display normal mode ON/OFF	0	Display Normal Mode OFF.										
			1	Display Normal Mode ON.										
	D15	Vertical scrolling status	0	Scroll OFF										
	D14	Not used	0	-										
	D13	Inversion status	0	Not defined										
	D12	All pixel ON	0	Not defined										
	D11	All pixel OFF	0	Not defined										
	D10	Display ON/OFF	0											
			1	Display is ON										
	D9	Tearing effect line ON/OFF	0	Tearing Effect Line OFF										
			1	Tearing Effect ON										
	D5	Tearing effect line mode	0	Mode 1, V-Blanking only										
			1	Mode 2, both H-Blanking and V-Blanking										
	D4	Not used	0	-										
	D3	Not used	0	-										
	D2	Not used	0	-										
D1	Not used	0	-											
D0	Not used	0	-

5.2.3. Enter Sleep Mode (10h)

10h	Enter Sleep Mode																								
	D/CX	RDX	WRX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	XX	0	0	0	1	0	0	0	0	10h												
Parameter	No Parameter																								
Description	<p>This command causes the LCD module to enter the minimum power consumption mode. In this mode e.g. the DC/DC converter is stopped, Internal oscillator is stopped, and panel scanning is stopped</p> <p>MCU interface and memory are still working and the memory keeps its contents. X = Don't care</p>																								
Restriction	<p>This command has no effect when module is already in sleep in mode. Sleep In Mode can only be left by the Sleep Out Command (11h). It will be necessary to wait 5msec before sending next to command, this is to allow time for the supply voltages and clock circuits to stabilize. It will be necessary to wait 120msec after sending Sleep Out command (when in Sleep In Mode) before Sleep In command can be sent.</p>																								
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>													Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

HW Reset	Sleep IN Mode																								

5.2.4.Sleep Out Mode (11h)

11h	Sleep Out Mode																								
	D/CX	RDX	WRX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	XX	0	0	0	1	0	0	0	1	11h												
Parameter	No Parameter																								
Description	This command turns off sleep mode. the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started. X = Don't care																								
Restriction	This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command, this is to allow time for the supply voltages and clock circuits stabilize. The display module loads all display supplier's factory default values to the registers during this 5msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when the display module is already Sleep Out –mode. The display module is doing self-diagnostic functions during this 5msec. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.																								
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>													Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

4 th Parameter	1	1	↑	XX	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0	67

Description

This command defines the partial mode's display area. There are 2 parameters associated with this command, the first defines the Start Row (SR) and the second the End Row (ER), as illustrated in the figures below. SR and ER refer to the Frame Memory Line Pointer.

If End Row > Start Row when MADCTL B4=0:-

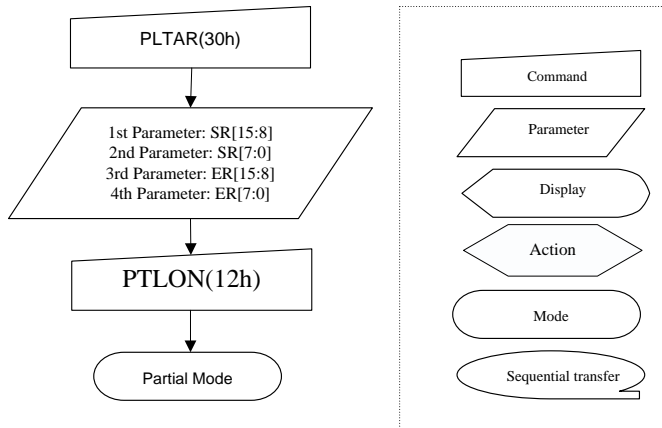

If End Row > Start Row when MADCTL B4=1:-

If End Row < Start Row when MADCTL B4=0:-

	<p>If End Row = Start Row then the Partial Area will be one row deep. X = Don't care.</p>														
Restriction	SR [15...0] and ER [15...0] cannot be 0000h nor exceed 0167h.

5.2.18. Memory Access Control(36h)

36h	Tearing Effect Line ON												
	D/CX	RDX	WRX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	0	1	↑	XX	0	0	1	1	0	1	1	0	36h
Parameter	1	1	↑	XX	MY	MX	MV	ML	BGR	MH	0	0	00

This command defines read/write scanning direction of frame memory.
 This command makes no change on the other driver status.

Bit	Name	Description
MY	Row Address Order	These 3 bits control MCU to memory write/read direction.
MX	Column Address Order	
MV	Row / Column Exchange	
ML	Vertical Refresh Order	LCD vertical refresh direction control.
BGR	RGB-BGR Order	Color selector switch control (0=RGB color filter panel, 1=BGR color filter panel)
MH	Horizontal Refresh ORDER	LCD horizontal refreshing direction control.

Note: When BGR bit is changed, the new setting is active immediately without update the content in Frame Memory again.

5.2.19. Vertical Scrolling Start Address (37h)

37h	VSCRSADD (Vertical Scrolling Start Address)												HEX
	D/CX	RDX	WRX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	
Command	0	1	↑	XX	0	0	1	1	0	1	1	1	37h
1 st Parameter	1	1	↑	XX	VSP [15:8]							00	
2 nd Parameter	1	1	↑	XX	VSP [7:0]							00	

This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area

and the scrolling mode. The Vertical Scrolling Start Address command has one parameter which describes the address of the line in the Frame Memory that will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:-

When MADCTL B4=0

Example:

When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 360 and VSP='3'.

Description

When MADCTL B4=1

Example:

When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 360 and VSP='3'.

Note: (1) When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect. VSP refers to the Frame Memory line

GC9B71 Datasheet

	<p><i>Pointer.</i></p> <p><i>(2) This command is ignored when the GC9B71 enters Partial mode.</i></p> <p>X = Don't care</p>

Description	<p>This command transfers image data from the host processor to the display module's frame memory continuing from the pixel location following the previous write_memory_continue or write_memory_start command.</p> <p>If set_address_mode B5 = 0: Data is written continuing from the pixel location after the write range of the previous write_memory_start or write_memory_continue. The column register is then incremented and pixels are written to the frame memory until the column register equals the End Column (EC) value. The column register is then reset to SC and the page register is incremented. Pixels are written to the frame memory until the page register equals the End Page (EP) value and the column register equals the EC value, or the host processor sends another command. If the number of pixels exceeds $(EC - SC + 1) * (EP - SP + 1)$ the extra pixels are ignored.</p> <p>If set_address_mode B5 = 1: Data is written continuing from the pixel location after the write range of the previous write_memory_start or write_memory_continue. The page register is then incremented and pixels are written to the frame memory until the page register equals the End Page (EP) value. The page register is then reset to SP and the column register is incremented. Pixels are written to the frame memory until the column register equals the End column (EC) value and the page register equals the EP value, or the host processor sends another command. If the number of pixels exceeds $(EC - SC + 1) * (EP - SP + 1)$ the extra pixels are ignored.</p> <p>Sending any other command can stop frame Write.</p> <p>Frame Memory Access and Interface setting (B3h), WEMODE=0 When the transfer number of data exceeds $(EC-SC+1)*(EP-SP+1)$, the exceeding data will be ignored.</p> <p>Frame Memory Access and Interface setting (B3h), WEMODE=1 When the transfer number of data exceeds $(EC-SC+1)*(EP-SP+1)$, the column and page number will be reset, and the exceeding data will be written into the following column and page.</p>												

Restriction	A write_memory_start should follow a set_column_address, set_page_address or set_address_mode to define the write address. Otherwise, data written with write_memory_continue is written to undefined addresses.

6. Electrical Characteristics

6.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When GC9B71 is used out of the absolute maximum ratings, GC9B71 may be permanently damaged. To use GC9B71 within the following electrical characteristics limitation is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, GC9B71 will malfunction and cause poor reliability.

Table43.

Item	Symbol	Unit	Value
Supply voltage	VDDDB	V	-0.3~+4.6
Supply voltage(Logic)	VDDI	V	-0.3~+4.6
Supply voltage(Digital)	DVDD	V	-0.3~+2.0
Driver supply voltage	VGH-VGL	V	-0.3~+27.0
Logic input voltage range	VIN	V	-0.3~VDDI+0.3
Logic output voltage range	VO	V	-0.3~VDDI+0.3
Operation temperature	Topr	°C	-40~+80
Storage temperature	Tstg	°C	-40~+80

Note: If the absolute maximum rating of even is one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

6.2. DC Characteristics

6.2.1. DC Characteristics for Panel Driving

General DC Characteristics

Table44.

Item	Symbol	Unit	Condition	Min.	Typ.	Max.	Note
Power and Operation Voltage							
Analog Operating Voltage	VDDB	V	Operating voltage	2.5	2.8	3.3	Note2
Logic Operating Voltage	VDDI	V	I/O supply voltage	1.65	2.8	3.3	Note2
Digital Operating voltage	DVDD	V	Digital supply voltage	-	1.5	-	Note2
Gate Driver High Voltage	VGH	V	-	8.0	-	15.0	Note3
Gate Driver Low Voltage	VGL	V	-	-12.0	-	-7.0	Note3
Input and Output							
Logic High Level Input Voltage	VIH	V	-	0.7*VD DI	-	VDDI	Note1,2,3
Logic Low Level Input Voltage	VIL	V	-	VSSB	-	0.3*VD DI	Note1,2,3
Logic High Level Output Voltage	VOH	V	IOL=-1.0mA	0.8*VD DI	-	VDDI	Note1,2,3
Logic Low Level Output Voltage	VOL	V	IOL=1.0mA	VSSB	-	0.2*VD DI	Note1,2,3
Logic High Level Input Current	IIH	uA	-	-	-	1	Note1,2,3
Logic Low Level Input Current	IIL	uA	-	-1	-	-	Note1,2,3
Logic Input Leakage Current	ILEA	uA	VIN=VDDI or VSSB	-0.1	-	+0.1	Note1,2,3
Source Driver							
Positive Source Output Range	Vsout	V	-	VREG1 B	-	VREG1 A	
Negative Source Output Range	Vsout	V	-	VREG2 A	-	VREG2 B	

Note 1: VDDI=1.65 to 3.3V, VDDB=2.5 to 3.3V, AGND=VSS=0V, Ta=-30 to 70 (to +85 no damage)°C

Note2: Please supply digital VDDI voltage equal or less than analog VDDB voltage.

Note3: CSX, RDX, WRX, D[7:0], D/CX, RESX, TE, SDA, SCL, IM2, IM1, IM0, and Test pins.

6.2.2. DC characteristics for DSI LP mode

DC levels of the LP-00, LP-01, LP-10 and LP-11 are defined on table below: DC Characteristics for DSI LP mode when LP-RX, LP-CD or LP-TX is mentioned on the condition column. Other logical levels of the table are for MCU interface.

parameter	symbol	condition	Specification			Unit
			Min.	Typ.	Max.	
Logic High level output voltage	V_{OH}	$I_{OUT}=-1mA$;Note 2	0.8IOVCC	-	IOVCC	V
Logic Low level output voltage	V_{OL}	$I_{OUT}=-1mA$; Note 2	0.0	-	0.2 IOVCC	V
Logic High level input voltage	V_{IHLPCD}	LP-CD ; Note 3	450	-	1350	mV
Logic Low level input voltage	V_{ILLPCD}	LP-CD ; Note 3	0.0	-	200	mV
Logic High level input voltage	V_{IHLPRX}	LP-RX (CLOCK, DATA) ; Note 3	880	-	1350	mV
Logic Low level input voltage	V_{ILLPRX}	LP-RX (CLOCK, DATA) ; Note 3	0.0	-	550	mV
Logic Low level input voltage	$V_{ILLPRXULP}$	LP-RX (CLOCK ULP mode), Note 3	0.0	-	300	mV
Logic high level output voltage	V_{OHLPTX}	LP-TX (DATA), Note 3	1.1	-	1.3	V
Logic Low level output voltage	V_{OLLPTX}	LP-TX (DATA), Note 3	-50	-	50	mV
Logic High level input current	I_{IH}	LP-CD, LP-RX, Note 3	-	-	10	uA
Logic Low level input current	I_{IL}	LP-CD, LP-RX, Note 3	-10	-	-	uA

Note: (1) $T_a=-30^{\circ}C$ to $70^{\circ}C$ (to $+85^{\circ}C$ no damage)

(2) PWM_OUT, TE

(3) DSI High Speed mode is off

6.2.3. DC characteristics for DSI HS mode

DC levels of the HS-0 and HS-0 are defined on table below: DC Characteristics for DSI HS mode.

parameter	symbol	condition	Specification			Unit
			Min.	Typ.	Max.	
Input Common Mode Voltage for Clock	V_{CMCLK}	DSI-CLOCK_P/N ; Note 2,3	70	-	330	mV
Input Common Mode Voltage for Data	V_{CMDATA}	DSI-DATA_P/N ; Note 2,3	70	-	330	mV
Common Mode Ripple for Clock Equal or Less than 450MHz	$V_{CMRCLKL450}$	DSI-CLOCK_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Data Equal or Less than 450MHz	$V_{CMRDATA450}$	DSI-DATA_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Clock More than 450MHz (peak sine wave)	$V_{CMRCLKM450}$	DSI-CLOCK_P/N	-	-	100	mV
Common Mode Ripple for Data More than 450MHz (peak sine wave)	$V_{CMRDATA450M}$	DSI-DATA_P/N	-	-	100	mV
Differential Input Low Level Threshold Voltage for Clock	$V_{THLCLK-}$	DSI-CLOCK_P/N	-70	-	-	mV
Differential Input Low Level Threshold Voltage for Data	$V_{THLDATA-}$	DSI-DATA_P/N	-70	-	-	mV
Differential Input High Level Threshold Voltage for Clock	$V_{THHCLK+}$	DSI-CLOCK_P/N	-	-	70	mV
Differential Input High Level Threshold Voltage for Data	$V_{THHDATA+}$	DSI-DATA_P/N	-	-	70	mV
Single-ended Input Low Voltage	V_{ILHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-40	-	-	mV
Single-ended Input High Voltage	V_{IHHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-	-	460	mV
Differential Termination Resistor	R_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	80	100	125	Ω
Single-ended Threshold Voltage for Termination Enable	$V_{TERM-EN}$	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	450	mV

GC9B71 Datasheet

Termination Capacitor	C_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	14	pF
-----------------------	-------------------	--------------------------------	---	---	----	----

Note: (1) $T_a = -30$ to 70 °C (to $+85$ °C no damage), IOVCC = 1.65 to 1.95V, GND = 0V

(2) Includes 50mV (-50mV to 50mV) ground difference

(3) Without $V_{\text{CMRCLKM450}}/V_{\text{CMRDATAM450}}$

(4) Without 50mV (-50mV to 50mV) ground difference

6.3. AC Characteristics

6.3.1. Display Parallel 8-bit Interface Timing Characteristics (8080-I)

Figure90.

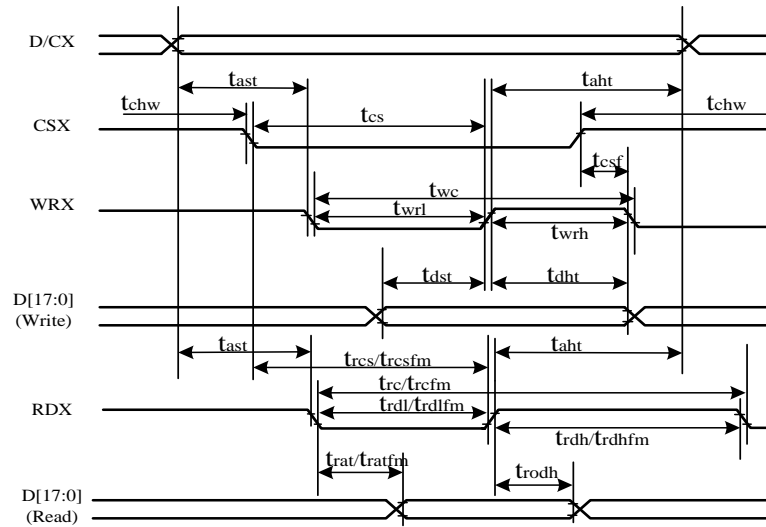

Table45.

Signal	Symbol	Parameter	min	max	Unit	Description
DCX	tast	Address setup time	0	-	ns	
	taht	Address hold time(Write/Read)	0	-	ns	
CSX	tchw	CSX "H" pulse width	0	-	ns	
	tcs	Chip Select setup time(Write)	15	-	ns	
	trcs	Chip Select setup time(Read ID)	45	-	ns	
	trcsfm	Chip Select setup time(Read FM)	355	-	ns	
WRX	tcsf	Chip Select Wait time (Write/Read)	10	-	ns	
	twc	Write Cycle	66	-	ns	
	twrl	Write Control pulse L duration	15	-	ns	
RDX(FM)	twrh	Write Control pulse H duration	15	-	ns	
	trcfm	Read Cycle (FM)	380	-	ns	
	trdhfm	Read Control H duration(FM)	180	-	ns	
RDX(ID)	trdlfm	Read Control L duration(FM)	200	-	ns	
	trc	Read Cycle (ID)	160	-	ns	
	trdh	Read Control H pulse duration	90	-	ns	
D[7:0]	trdl	Read Control L pulse duration	70	-	ns	
	tdst	Write data setup time	10	-	ns	For maximum CL=30pF For minimum CL=8pF
	tdht	Write data hold time	10	-	ns	
	trat	Read access time	-	40	ns	
	tratfm	Read access time	-	340	ns	
trod	Read output disable time	20	80	ns		

Note: $T_a = -30$ to 70 °C, $V_{DDI}=1.65V$ to $3.3V$, $V_{DDB}=2.5V$ to $3.3V$, $V_{SS}=0V$

Figure91.

CSX timings :

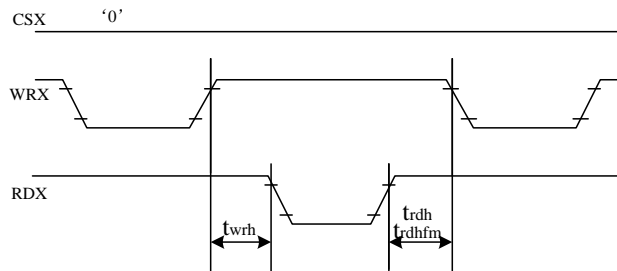

Figure92.

Note: Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

Write to read or read to write timings:

Figure92.

Note: Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

6.3.2. Display Serial Interface Timing Characteristics (3-line SPI system)

Figure97.

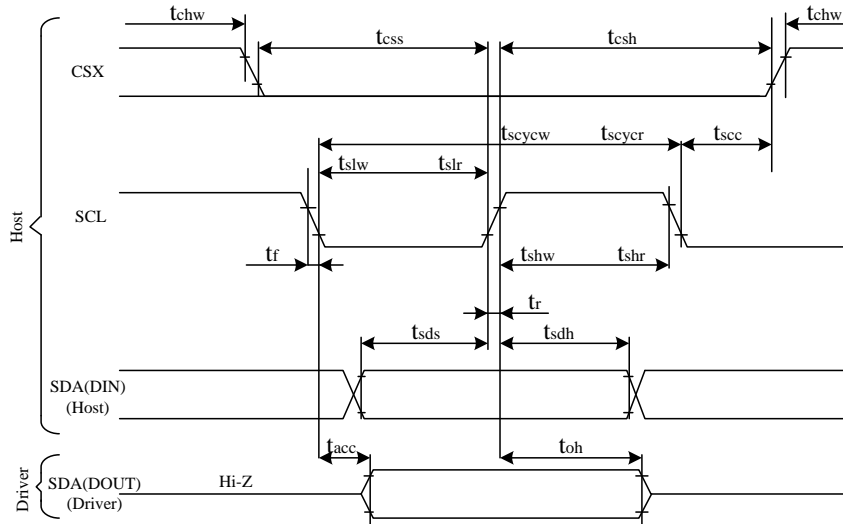

Table47.

Signal	Symbol	Parameter	min	max	Unit	Description
SCL	tscycw	Serial Clock Cycle (Write)	10	-	ns	
	tshw	SCL "H" Pulse Width (Write)	5	-	ns	
	tslw	SCL "L" Pulse Width (Write)	5	-	ns	
	tscycr	Serial Clock Cycle (Read)	150	-	ns	
	tshr	SCL "H" Pulse Width (Read)	60	-	ns	
	tslr	SCL "L" Pulse Width (Read)	60	-	ns	
SDA /D0 (Input)	tsds	Data setup time (Write)	5	-	ns	
	tsdh	Data hold time (Write)	5	-	ns	
SDA/D0 (Output)	tacc	Access time (Read)	10	-	ns	
CSX	tsc	SCL-CSX	10	-	ns	
	tchw	CSX "H" Pulse Width	10	-	ns	
	tcss		20	-	ns	
	tcsh	CSX-SCL Time	40	-	ns	

Note: $T_a = 25\text{ }^\circ\text{C}$, $V_{DDI}=1.65\text{V to }3.3\text{V}$, $V_{DDB}=2.5\text{V to }3.3\text{V}$, $V_{SSB}=V_{SSB}=0\text{V}$

Figure98.

6.3.3. Display Serial Interface Timing Characteristics (4-line SPI system)

Figure98.

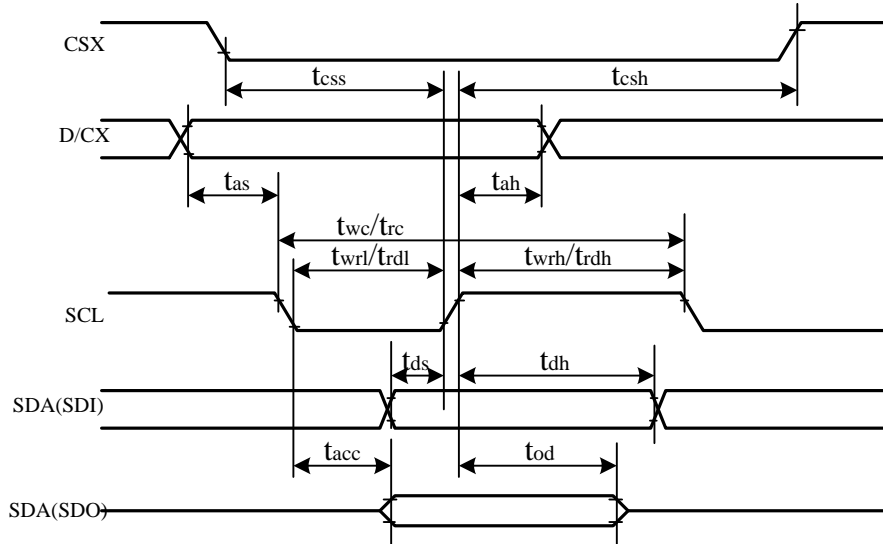

Table48.

Signal	Symbol	Parameter	min	max	Unit	Description
CSX	t_{css}	Chip select time (Write)	20	-	ns	
	t_{csh}	Chip select hold time (Read)	40	-	ns	
SCL	t_{wc}	Serial Clock Cycle (Write)	10	-	ns	
	t_{wrh}	SCL "H" Pulse Width (Write)	5	-	ns	
	t_{wrl}	SCL "L" Pulse Width (Write)	5	-	ns	
	t_{rc}	Serial Clock Cycle (Read)	150	-	ns	
	t_{rdh}	SCL "H" Pulse Width (Read)	60	-	ns	
	t_{rdl}	SCL "L" Pulse Width (Read)	60	-	ns	
D/CX	t_{as}	D/CX setup time	10	-	ns	
	t_{ah}	D/CX hold time (Write/Read)	10	-	ns	
SDA/D0 (Input)	t_{ds}	Data setup time (Write)	5	-	ns	
	t_{dh}	Data hold time (Write)	5	-	ns	
SDA/D0 (Output)	t_{acc}	Access time (Read)	10	-	ns	

Note: $T_a = 25\text{ }^\circ\text{C}$, $V_{DDI}=1.65\text{V to }3.3\text{V}$, $V_{DDB}=2.5\text{V to }3.3\text{V}$, $AGND=VSS=0\text{V}$

Figure99.

6.4. MIPI

6.4.1. High Speed Mode – Clock Channel Timing

Signal	Symbol	Parameter	Min	Max	Unit
DSI_CLOCK_P/N	$2xUI_{INST}$	Double UI instantaneous	8	25	ns
DSI_CLOCK_P/N	UI_{INSTA}, UI_{INSTB}	UI instantaneous Half	4	12.5	ns

Note: $UI = UI_{INSTA} = UI_{INSTB}$

6.4.2.High Speed Mode – Rise and Fall Timings

Signal	Symbol	Condition	specification			Unit
			Min	Max	Type	
Differential Rise Time for Clock	t_{DRTCLK}	DSI-CLOCK_P/N	-	-	900	ps
Differential Rise Time for Data	$t_{DRTDATA}$	DSI-DATA_P/N	-	-	900	ps
Differential Fall Time for Clock	t_{DFTCLK}	DSI-CLOCK_P/N	-	-	900	Ps
Differential Fall Time for Data	$t_{DFTDATA}$	DSI-DATA_P/N	-	-	900	ps

6.4.3.High Speed Mode – Rise and Fall Timings

Signal	Symbol	Condition	specification			Unit
			Min	Max	Type	
Differential Rise Time for Clock	t_{DRTCLK}	DSI-CLOCK_P/N	-	-	900	ps
Differential Rise Time for Data	$t_{DRTDATA}$	DSI-DATA_P/N	-	-	900	ps
Differential Fall Time for Clock	t_{DFTCLK}	DSI-CLOCK_P/N	-	-	900	Ps
Differential Fall Time for Data	$t_{DFTDATA}$	DSI-DATA_P/N	-	-	900	ps

6.4.4. Low Speed Mode – Bus Turn Around

Lower Power Mode and its State Periods are illustrated for reference purposes on the Bus Turnaround (BTA) from the MCU to the GC9B71 sequence below.

Lower Power Mode and its State Periods are illustrated for reference purposes on the Bus Turnaround (BTA) from GC9B71 to the MCU sequence below.

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	T_{LPXM}	Length of LP-00, LP-01, LP-10 or LP-11 periods MCU → GC9B71	50	-	ns
Input (DSI-DATA_P/N)	$T_{TA-SUREM}$	Time-out before the GC9B71 starts driving	T_{LPXM}	$2 \times T_{LPXM}$	ns
Output (DSI-DATA_P/N)	T_{LPXD}	Length of LP-00, LP-01, LP-10 or LP-11 periods GC9B71 → MCU	50	75	ns
Output (DSI-DATA_P/N)	$T_{TA-SURED}$	Time-out before the MCU starts driving	T_{LPXD}	$2 \times T_{LPXD}$	

7.

Signal	Symbol	Description	Time	Unit
Input (DSI-DATA_P/N)	$T_{TA-GETD}$	Time to drive LP-00 by GC9B71	$5 \times T_{LPXD}$	ns
Output (DSI-DATA_P/N)	T_{TA-GOD}	Time to drive LP-00 after turnaround request - MCU	$4 \times T_{LPXD}$	ns

6.4.5. Data Lanes from Low Power Mode to High Speed Mode

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	T_{LPX}	Length of any low power state period	50	-	ns
Input (DSI-DATA_P/N)	$T_{HS-PREPARE}$	Time to Drive LP-00 to prepare for HS Transmission	$40+4xUI$	$85+6xUI$	ns
Input (DSI-DATA_P/N)	$T_{HS-TERM-EN}$	Time to enable Data Lane Receiver line termination measured from when Dn crosses V_{ILMAX}	-	$35+4xUI$	ns

Note: UI definition: $UI = UI_{INSTA} = UI_{INSTB}$

6.4.6. Data Lanes from High Speed Mode to Low Power Mode

Note:

If the last load bit is HS-1, the transmitter changes from HS-1 to HS-0.

If the last load bit is HS-0, the transmitter changes from HS-0 to HS-1.

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	$T_{TA-SKIP}$	Time-out at GC9B71 to Ignore Transition Period of EoT	40	4xUI	ns
Output (DSI-DATA_P/N)	$T_{TA-EXIT}$	Time to Driver LP-11 after HS burst	100	-	ns

6.4.7.DSI Clock Burst – High Speed Mode to/from Low Power Mode

Signal	Symbol	Description	Min	Max	Unit
Input (DSI-DATA_P/N)	$T_{CLK-POST}$	Time that the MCU shall continue sending HS clock after the last associated Data Lanes has transitioned to LP mode	$60+52xUI$	-	ns
Input (DSI-DATA_P/N)	$T_{CLK-TRAIL}$	Time to drive HS differential state after last payload clock bit of a HS transmission burst	60	-	ns
Input (DSI-DATA_P/N)	$T_{HS-EXIT}$	Time to drive LP-11 after HS burst	100	-	ns
Input (DSI-DATA_P/N)	$T_{CLK-PREPARE}$	Time to drive LP-00 to prepare for HS transmission	38	95	
Input (DSI-DATA_P/N)	$T_{CLK-TERM-EN}$	Time-out at Clock Lane to enable HS termination	38	-	
Input (DSI-DATA_P/N)	$T_{CLK-PREPARE}$	Minimum lead HS-0 drive period before starting Clock	300		
Input (DSI-DATA_P/N)	$T_{CLK-PRE}$	Time that the HS clock shall be driven prior to any associated Data Lane beginning the transition from LP to HS mode	$8xUI$		

Note: UI definition: $UI = UI_{INSTA} = UI_{INSTB}$
